WHAT WORKS?

COMMON PRACTICES IN HIGH FUNCTIONING AFTERSCHOOL PROGRAMS: THE NATIONAL PARTNERSHIP FOR QUALITY AFTERSCHOOL LEARNING FINAL REPORT

Abstract

In an effort to identify and incorporate quality practices into existing and future afterschool programs, the U.S. Department of Education commissioned the National Partnership for Quality Afterschool Learning (National Partnership) to study high functioning 21st Century Community Learning Center programs. The purpose of this study was to document practices to be used to develop resources and professional development that address issues relating to the establishment and sustainability of afterschool programs, to provide models and indicators of promising practices, and to highlight other descriptive information that local sites can access in planning new afterschool programs or improve existing ones. Fifty-three afterschool programs, representing eight regional divisions of the nation, including rural and urban programs and community-based and school district related programs, were identified using rigorous methods. Promising practices in content delivery, program organization, and program structure were studied. The findings were synthesized into the National Partnership's Afterschool Training Toolkit, which was made available to programs nationwide via the World Wide Web. Based on the study findings, the National Partnership conducted professional development consistently and extensively throughout the nation.

CHAPTER 1:

INTRODUCTION

Since the implementation of the No Child Left Behind Act, a greater emphasis has been placed on academic development during the afterschool hours. Research has found that students' participation in afterschool programs is beneficial to academic achievement and social adjustment (Lauer et al., 2006; Vandell, Reisner, & Pierce, 2007). A longitudinal study conducted by Mahoney, Lord, and Carryl (2005) found that students who participated in afterschool programs had significantly higher reading achievement and were rated by teachers as having a greater expectancy of success than students who did not participate in afterschool programs.

One mechanism in which afterschool programs influence students' academic achievement is through the provision of homework assistance. An evaluation of 21st Century Community Learning Center (CCLC) programs conducted by Mathematica Policy Research (Dynarski et al., 2003) noted that homework sessions tend to be the most common type of academic support both in elementary and middle school programs; yet the quality of support is generally low. At the same time, studies have found that homework and tutoring programs that rely on untrained or minimally trained volunteers often do little to boost students' academic performance (Fashola, 2002). Instead, research on effective approaches to teaching and learning continue to emphasize the need to actively engage students and delve deeply into subject matter, providing "opportunities to learn with understanding" in combination with "a deep foundation of factual knowledge" (Bransford et al., 2000, p. 16).

In addition to the challenges around hiring qualified staff, afterschool programs can also be plagued with attrition and a low frequency of student participation (Dynarski et al., 2003; Grossman et al., 2002). Attrition and low attendance are of particular concern because research has found that those students who participate in afterschool programs the longest (both in terms of frequencies and durations) make the biggest gains (Goldschmidt, Huang, & Chinen, 2007; Vandell, Reisner, & Pierce, 2007) and higher rates of participation in afterschool programs resulted in higher scores on academic standardized tests in mathematics, literacy, and language arts (Huang, Gribbons, Kim, Lee, & Baker, 2000). Similarly, Munoz (2002) found a positive correlation between the number of visits to afterschool programs and improved school attendance and academic achievement. Thus students who infrequently attend the afterschool programs are unlikely to reap academic and social benefits.

In an effort to identify and incorporate quality practices into existing and future afterschool programs, the U.S. Department of Education recognized the need for a large-scale project to study high functioning 21st Century Community Learning Center (CCLC) programs that would result in the creation of strategies, tools, and professional development for afterschool programs. In 2003, through a competitive solicitation process, the National Partnership for Quality Afterschool Learning (National Partnership), led by SEDL and in partnership with the Mid-continent Research for Education and Learning (McREL), National Center for Research on Evaluation, Standards, and Student Testing (CRESST), Northwest Regional Educational Laboratory (NWREL), SERVE Center at the University of North Carolina at Greensboro, WGBH Educational Foundation, and Institute for Responsive Education (IRE)¹, contracted with the U.S. Department of Education for a 5-year project to support program quality among the growing number of 21st CCLCs throughout the United States.

This 5-year project provided strategies, tools, and technical assistance to afterschool programs to address two continuing challenges identified via research on afterschool programs: (a) ensuring that programs offer high quality, researched-based academic content utilizing appropriate methods of teaching and learning, and (b) ensuring that programs are able to attract and retain students who participate regularly and thus can benefit from these investments.

There were five major tasks for this project aimed at improving the delivery and quality of academic content, teaching, and professional development in afterschool programs.

- **Task 1.** Identification of afterschool sites across the United States that are demonstrating exemplary or promising practices.
- **Task 2.** Validation of afterschool success in the content areas of literacy, math, science, arts, technology, and homework help through data analysis and site visitation.
- **Task 3.** Product development of tools, models, expertise, and other assistance to increase the number of quality afterschool sites across the United States
- **Task 4.** Provision of technical assistance to promising afterschool sites to help them achieve “exemplary” status and support state education agencies in building their own capacity for technical assistance, including assisting their grantees in a similar technical-assistance-building process.
- **Task 5.** Partnering with the U.S. Department of Education and state education agencies to provide professional development opportunities for afterschool sites in adopting high quality practices, specifically in content areas designed to increase student achievement and attract high levels of student participation.

¹ The IRE left the National Partnership in 2004.

To complete Tasks 1 and 2, CRESST conducted a descriptive study to document practices to be used by the National Partnership to 1) develop resources and professional development that address issues relating to the establishment and sustainability of afterschool programs, 2) provide models and indicators of promising practices, 3) highlight other descriptive information that local sites can access in planning new afterschool programs or improve existing ones (e.g., the Promising Practices in Afterschool System and the Harvard Family Research Project's database of afterschool programs), and 4) assist in assessing the effectiveness of afterschool programs in general, including attention to performance standards, review and meta-analyses of research, and rigorous evaluation methods to identify "what works."

In Years 1 through 3 of the project, Task 1 was completed after CRESST conducted a comprehensive search and selection process involving primary and secondary screenings of afterschool programs throughout the United States. These screenings were based on an established set of criteria, including evidence of academic performance of attendees, Annual Performance Report (APR) data, 21st CCLC Profile and Performance Information Collection System (PPICS) data, sample size, and recommendations from regional partners. As a result of this process, a total of 53 afterschool programs were identified for study and recruited for site visits. For Task 2, National Partnership team members conducted 96 site visits at 53 afterschool programs. Interviews were conducted with the project director, site coordinators, and program instructors. In addition, surveys were administered to site instructors, site coordinators, and parents. Based on CRESST's findings, Task 3 activities included the development of toolkits and self-assessments created to provide afterschool programs with research-based tools and strategies to improve curriculum implementation in the six content areas of study (literacy, math, science, technology, arts, and homework), and to evaluate their programs regularly and independently. Products, such as the Afterschool Training Toolkit, were made available to programs nationwide via the World Wide Web. For Tasks 4 and 5, the National Partnership conducted professional development consistently and extensively throughout the nation, and collaborated with the U.S. Department of Education and state education agencies to build the technical assistance capacity of 21st CCLC program staff.

Purpose of the Report

This report provides a synthesis of the qualitative and quantitative findings from the field study conducted across the nation and the validation of promising practices across the six content areas. The following chapters describe the 13 criteria presented in CRESST's

Theoretical Logic Model (see Figure 1) and the study design, methods, and results of the validation of promising practices in these content focuses. Chapter 2 discusses the program selection process and CRESST's process in developing the indicator system that guided validation. Chapter 3 explains the National Partnership's data collection processes and elaborates on evaluation methodology, procedures, and instruments employed by CRESST in the analyses. Chapter 4 describes the internal program structure of the 53 afterschool programs in the study sample. Chapter 5 provides the findings on program process, including parent involvement, connecting with the community, and relationship building with students. Chapter 6 examines program-based content practices in terms of curricular goals, alignment with state standards, and links to day-school curricula. This chapter also summarizes findings on student enrichment and research-based practices. Chapter 7 describes afterschool program evaluation efforts and summarizes the results of program impact. The final chapter highlights implications from the study, including common promising afterschool practices and conclusions for quality afterschool programming.

CHAPTER 2:

STUDY DESIGN

IDENTIFICATION OF PROMISING AFTERSCHOOL PRACTICES

This chapter describes the National Partnership's data collection processes, and elaborates on methodology, procedures, and instruments developed by CRESST. Year 1 of the study focused on literacy and math content practices, Year 2 on science and arts content practices, and Year 3 on technology and homework help practices. An indicator system was designed first to guide the instrument development and validation procedures. Then a process was developed and implemented to identify and select programs in the study.

Preparation Process for Development of the Indicator System and Standards

To develop an indicator system for program identification and validation, CRESST drew on a number of sources for information and expertise throughout the process. An extensive review of the existing research literature on afterschool programs was conducted, investigating the organizational, curricular, and environmental variables that have been linked to program quality. CRESST then reviewed publications from organizations across the country involved in afterschool program evaluation and support. These organizations included: the National Center for Community Education, Promising Practices in After School Systems, the National Institute on Out-of-School Time, the Harvard Family Research Project, the National Community Education Association, the After School Alliance, the After School Corporation, the C.S. Mott Foundation, Learning Point Associates, Manpower Demonstration Research Corporation, and the Institute for Educational Science. A review of these sources focused on common variables and processes associated with positive afterschool program outcomes.

CRESST also received considerable guidance for indicator development from the National Partnership's content focus teams, which comprised experts in the field related to each academic area. The math team was led by McREL, the literacy team by NWREL, the science and homework help teams by SERVE, and the arts and technology teams by SEDL. Harris Cooper, a National Partnership Steering Committee member who is a recognized expert in homework studies, provided expert guidance in homework and technical issues, as did Elizabeth Reisner, Priscilla Little, and other members of the Steering Committee. Team members convened and provided CRESST with feedback on key curriculum content in their respective areas of expertise.

The Indicator System to Guide the Validation Process

To design an indicator system that could validate promising and exemplary practices, it was necessary to define the essential elements in a quality afterschool program. In general, quality afterschool programs were defined as having the ability “to deliver basic developmental inputs, which translate into practices and principles at the staff, program, and organizational level, and which result in positive outcomes for participants” (Hall, Yohalem, Tolman, & Wilson, 2003, p.51). Child development theories such as those by Bronfenbrenner (1979), Piaget (1952, 1964), and Vygotsky (1978) helped to provide a better understanding of how afterschool programs benefit student learning. These theories describe the importance of the social context of learning and how learning or cognitive development can be stimulated through interaction with peers and adults.

After extensive literature review and consultation, three central themes emerged: program quality evolves from (a) goal setting and evaluation, (b) curricular quality, and (c) program environment. Goal setting and evaluation involves theory and research-based programming, program structure, setting desired outcomes, and ongoing evaluation to ensure that goals are being met. Determination of curricular quality entails academic collaboration (linkage of afterschool programs to the day school), and opportunities for students to practice skills and reinforce motivation and engagement. Understanding the program environment includes social collaboration (school-staff communication), adequacy of physical and human resources (e.g., student-staff ratio, space, and materials), and literature on staff education, professional development, and attitudes (for more details see the program review plan in the National Partnership’s Year 1 report).

Findings from the literature served as the basis for the establishment of 13 indicators of success in delivering quality content and maintaining effective functionality in an afterschool setting:

- Setting of clear goals for content area practice (i.e., literacy, math, science, arts, technology, and homework help)
- Alignment of research-based activities to achieve goals
- Alignment of practice content materials with state standards
- Links between practice content activities and day-school activities
- Use of research-based curriculum and teaching strategies
- Provision of a positive program environment
- Employment of motivational strategies to engage students in learning
- Promotion of student engagement (e.g., encouraging meaningful experiences)

- Effective program management/support/resources (e.g., staff/student ratio, staff educational experience, ongoing evaluation)
- Provision of opportunities for student practice
- Periodic evaluation to check program effectiveness
- Periodic assessment to review student progress
- Resetting goals according to assessment results

These 13 indicators were built into a logic model (Figure 1) to guide the validation process of identifying promising and exemplary practices for this study.

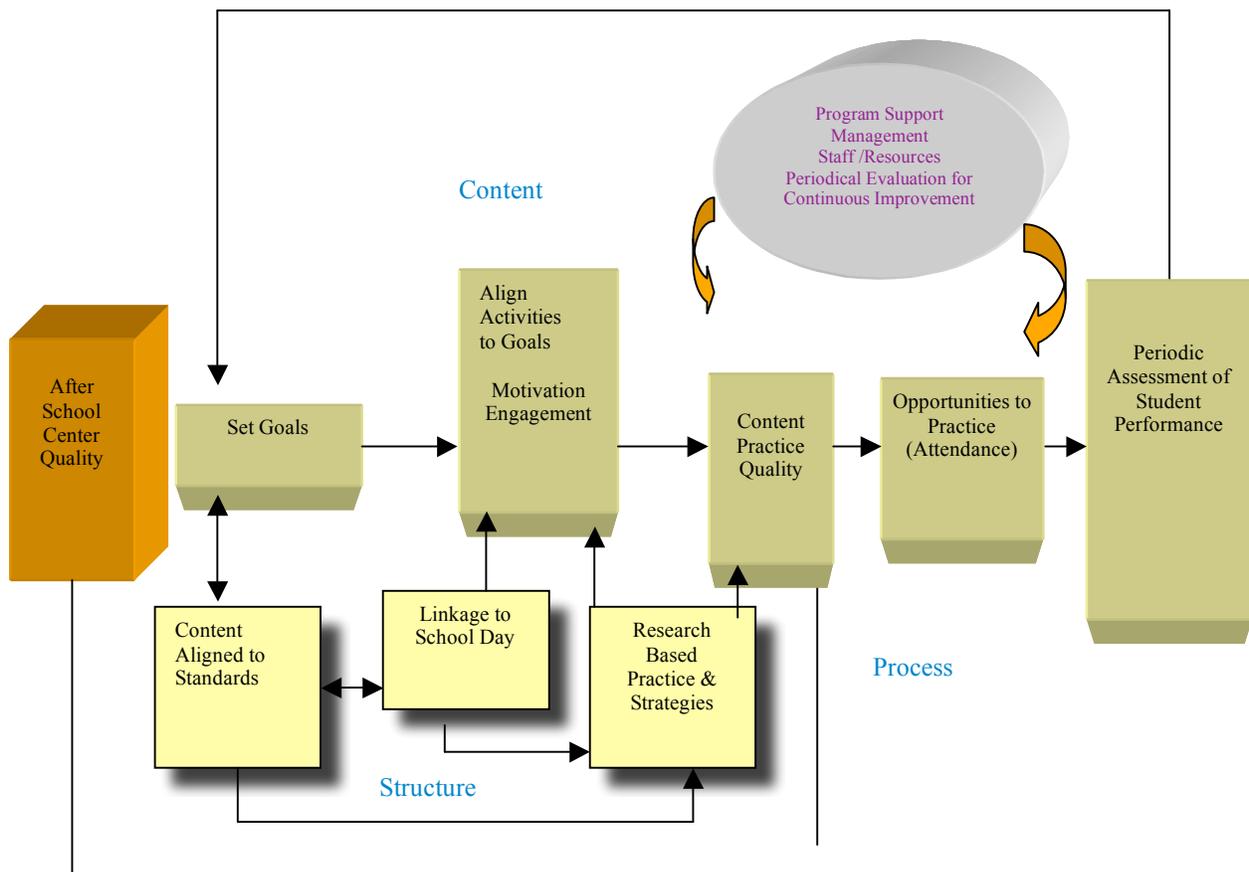

Figure 1. Theoretical logic model.

Further, the 13 indicators guided CRESST’s development of observation and site visit protocols and aided National Partnership team members in the implementation of the resulting instruments. The model provided a framework to examine the larger context of the afterschool environment and assess the effectiveness and efficiency of content practices at participating sites. One of the main objectives of this final report is to highlight the components of the theoretical logic model that are most likely to lead to program success.

Program Identification

To accomplish Task 1 on this project, CRESST identified 21st CCLC programs across the United States that demonstrated promising² practices in six content areas: literacy, math, science, arts, technology, and homework help. Programs in all of the content areas were selected based upon 1) nominations from state coordinators and experts in the afterschool field, 2) Annual Performance Report (APR)/Profile and Performance Information Collection System (PPICS) data, and 3) telephone interviews with afterschool program representatives. Program selection for literacy and math occurred in Year 1, for science and arts in Year 2, and for technology and homework help in Year 3. This section describes the process by which the programs were selected for the study sample.

Program Criteria

The APR/PPICS were the primary data sources used to identify promising programs.³ These reports were submitted by the 21st CCLC programs, and were provided to CRESST by the U.S. Department of Education. The APRs provided information including program objectives, grade levels served, number of students served, student demographics, student academic achievement data, hours/days per week the specific content curriculum offered, number of staff members in the program, and percentage of credentialed staff members. Information from 1,600 grantees was available for the selection process. Based on the variation in program types and size with different curricula foci, different criteria for selection were established across the distinct content areas. The criteria for each content area were as follows:

Year 1: Literacy and Math:

Each program should have 100 students or more.

Each program should have a minimum of 3 years of operation history to ensure that the content practice has the capacity to maintain its effects and show some signs of stability.

Each program should show that at least three of its sites offer the requisite content practices, as an indicator of stability and to improve the probability for the future success of practice duplication.

² To be identified as exemplary, programs must have had a quasi-experimental or experimental, external evaluation that showed evidence of program impact on student learning. No programs met this criteria; therefore, all programs in the study were identified as promising practice sites.

³ In Year 2, the U.S. Department of Education contracted Learning Point to convert the APR into electronic versions called PPICS.

Content practices should be offered a minimum of three times per week in order to allow sufficient time for student exposure to practices and materials, and to strengthen dosage effects.

Year 2: Science and Arts:

Each program should have 50 students or more.

Each program must show a minimum of 3 years of operation history to ensure that the content practice has the capacity to maintain its effects and show some signs of stability.

Each program must show that at least two of its sites are offering the requisite content practices, as an indicator of stability and to improve the probability for the future success of practice duplication.

Content practices must be offered a minimum of two times per week in order to allow sufficient time for students to be exposed to the practices and to absorb the materials.

Content practice at both arts and science programs should have a strong focus on at least one of the major disciplines. For arts programs, this could include a focus on dance, music, theater, or visual arts. For science programs, this could include a focus on physical science, life science, earth and space science, science and technology, science in personal and social perspectives, or history and nature of science.

Year 3: Technology and Homework:

Each program should have 50 students or more.

Each program must show a minimum of 2 years of operation history to ensure that the content practice has the capacity to maintain its effects and show some signs of stability.

Each program must show that at least two of its sites are offering the requisite content practices, as an indicator of stability and to improve the probability for the future success of practice duplication.

For Technology Only: Each program must show a minimum of 1 year using the technology curriculum.

Most important in the identification and selection process was the evidence of success in promoting student learning. Data in the following categories from the 2002 APRs for Year 1, 2004 APRs and PPICS for Year 2, and 2005 PPICS for Year 3 were used in this process:

1. Meeting/exceeding goals (as stated in the APR/PPICS). Programs that exceeded any of their stated goals were identified. A score was given for meeting, exceeding or not meeting their goals.

2. Teacher survey results. The 10 items constituting the teacher surveys reported in the APR/PPICS were reduced to one dimension using factor analysis (each of the items correlated with this one dimension with correlations ranging from .71 to .92). Higher scores were given indicating more “yes” responses to the teacher survey questions, generally implying higher quality.
3. Academic performance of attendees. Reported academic data came in three forms: (a) grade gains, (b) grade levels (above proficiency, at proficiency, etc.), and (c) percentile ranks. Since only a small subset of programs reported both percentile ranks and grade level gains scores for their attendees, it was necessary to standardize each score by converting it into a z score (mean = 0, standard deviation = 1) to make the different metrics reasonably comparable. To assure that programs working with low academic performers would not be penalized, a matched gains procedure was used. This process allowed programs starting with very low achievement, but demonstrating significant gains, an equal opportunity to be recognized and selected. Thus, academic scores from all program sites were rescaled and measures of percentage gains over the previous academic year were created. The scores were then aggregated from the site to the program level and weighted by the number of attendees at each site.

All of the scores derived from the APR/PPICS data were correlated to determine the consistency of results. The correlations were surprisingly low across the measures, and this necessitated focusing on the top performers by content area (i.e., basing standardized units above the mean grade level change or percentile rank change). In this way, even though the units of measure were not exactly the same, it was less significant because it was a center’s deviation from the mean that was most critical.

Finally, while the original intent was to select only those afterschool programs demonstrating high achievement gains and exceeding their goals, relatively few of the top performers exceeded their goals. Thus the original criteria were modified to require that at a minimum, selected afterschool programs met all of their stated goals. Further, given that academic scores were unlikely to capture the totality of program quality, steps were taken to expand the pool beyond those showing the greatest academic gains. For the final sample, all programs exceeding one or more of their goals were selected, as long as they did not demonstrate any academic declines. In Year 1, using a blinded procedure to validate the site selection methodology, an additional 5 math and 5 literacy programs were randomly selected and blended into the final pool to serve as a comparison control.

Secondary Screening

The initial identification process resulted in the selection of 342 programs (i.e., 47 literacy and math programs, 157 science and arts programs, and 138 technology and homework help programs). Additional screening activities were instituted to narrow the pool of 342 potential programs. National Partnership staff (blinded to the control procedures)

contacted the selected programs by telephone to introduce them to the project and collect updated and/or additional program information not available in the APR/PPICS. The telephone screening with program representatives, most often project directors, covered three primary topics: (a) program background, (b) content focus, and (c) self-evaluation/assessment methods. In terms of basic background information, the representatives were asked how long the site had been in operation, how many sites existed within their program, the population(s) served, the number of days and/or hours a week the program was in operation, and how they would characterize the relationship, if any, between the afterschool program and the day school. They were also asked about program goals, content areas covered, curricular links to standards, the nature of program instruction (purchased versus self-designed curricula, types of activities provided in the instruction of the six content areas, and components of their programs that were particularly noteworthy. Screening questions also focused on internal and external program evaluations and evidence of specific content impact on student achievement, learning, retention, and attendance.

The representatives were also asked to provide supporting materials including program brochures, sample lesson plans, goals and objectives, curricular mapping documents (i.e., linking afterschool content area instruction with state standards or day-school curriculum), and any other evidence of effective practice that the programs were willing to share. For the 21st CCLC programs CRESST initially selected, the two sites identified using the APR/PPICS data were discussed with the afterschool program's project director. The project directors were also asked to recommend two of their sites for the study site visits, in the event that their program was selected as part of the final sample.

Program recommendations, the additional information from the secondary screening, and the initial identification data were used to narrow the total number of programs down from 342 to 10 programs per content area. In addition to the criteria previously mentioned, program finalists were also selected based on factors such as: standards and research-based curricula and instruction, links to school day, effective integration of content practices into afterschool program instruction, staff qualifications, and evidence of program impact. Also, to assure promising practices in the general population were not overlooked, an additional seven non-21st CCLC programs⁴ were also recommended by state region coordinators and experts in the field to be considered. It should be noted here that the 10 random programs thrown into the selection pool as control measures, mentioned previously, were screened out during the process. Thus validating the screening procedure was effective.

⁴Programs not funded by the 21st Century Community Learning Centers.

Final Sample Selection

CRESST developed a proposed list of pre-identified programs and sent this to all National Partnership partners and Steering Committee members for review and suggestions. After careful screening and group deliberations, 60 program finalists⁵ were selected and presented to the National Partnerships’ content focus teams and Steering Committee, and the U.S. Department of Education for suggestions and feedback. Once the U.S. Department of Education approved the list, National Partnership staff contacted the programs to request their participation in the study. In total, 53 programs⁶ agreed to participate.

As detailed in the Methodology section of this report (Chapter 3), two sites within each of the selected afterschool programs were scheduled for the site visits. Specific considerations were taken to ensure that rural programs were represented in the final selections. Table 1 shows the geographical distribution of the 53 final programs selected. As shown in the table, there are eight rural programs and 45 urban programs. The representation is highest at the mid-south region with ten programs selected, followed by the southwest and northeast with nine programs selected in each.

Table 1
Geographical Distribution of Afterschool Programs

Content Areas	Regions																Total
	Rural/Urban																
	<i>Northwest</i>		<i>Southwest</i>		<i>Mid-South</i>		<i>Mid-West</i>		<i>Southeast</i>		<i>Mid-Atlantic</i>		<i>Northeast</i>		<i>North Central</i>		
	R	U	R	U	R	U	R	U	R	U	R	U	R	U	R	U	
Literacy		1		2		1		1	1			1		2		2	11
Math				1		2		1		1		1		1			7
Art		2		2		1		1			1		1		1		9
Science				1	1	3		1		1		1		1			9
Technology				3	1	1	2			1				2			10
Homework		2								1	1		2			1	7
Total	0	5	0	9	2	8	2	4	1	4	1	4	2	7	0	4	53

⁵ Ten candidates were proposed from each content area.

⁶ The program sample consisted of eleven literacy, seven math, nine arts, nine science, ten technology, and seven homework help programs. The number of literacy programs was increased to 11 as one program that was initially chosen as part of the math sample was more focused on literacy as seen in its site visits.

As seen in Table 2, of the 53 programs, 33 (62 percent) were affiliated with school districts, and 20 (38 percent) were community-based organizations (CBOs). Within the 20 community-based programs, 10 were run by large nonprofit organizations such as the YMCA, Boys and Girls Club, LA’s BEST, Foundations Inc., The After School Corporation, Children’s Aid Society, and others. None of the programs identified in this study were faith-based.

Table 2
Programs Affiliations by Content

Content area	School District	CBO	
		CBO	Nonprofit
Literacy	6	2	3
Math	4	2	1
Art	6	2	1
Science	6	2	1
Technology	6	1	3
Homework	5	1	1
Total	33	10	10

In addition, science, arts, and technology programs each had two programs actively collaborating with local universities or colleges. Except for science (both of the science programs that collaborated with local universities were district-affiliated), the large nonprofit community-based programs were more likely to collaborate with local universities and colleges. Some of the math, literacy, and homework programs used local college students as assistants and volunteers, but none of them were observed to be actively collaborating with universities or colleges.

CHAPTER 3:

METHODOLOGY AND VALIDATION PROCEDURES

In order to provide information that useful in improving academic content, teaching, and professional development in afterschool programs throughout the United States, the study focused on instructional quality by identifying and gathering information on programs exhibiting promising practices. A multi-method strategy incorporating both quantitative and qualitative data analyses—including surveys, site observations, and interviews—was employed in data collection. SEDL staff and partners conducted site visits and data collection on identified programs from 2004 to 2007. This chapter describes the study participants, the measures and protocols used, as well as the data collection procedures.

Program Sample

As described in Chapter 2 of this report, all programs were selected for this study using a complex process that included the development of selection criteria, a review of APR/PPICS and other data sources, and secondary screenings by telephone interview. The final sample consisted of 53 programs throughout the United States and 96 sites⁷ across the programs.

Most of the programs had been in operation for less than 10 years, with nearly all programs reporting their years of operation between 3 and 7. Depending on the geographical regions of the programs, the populations served across most programs were ethnically diverse, most common were Hispanic and African American populations. Others included Asian/Pacific Islanders, Portuguese, Dominican, and Whites. While White students had higher representation in the rural programs, most urban programs served a majority of English Language Learner (ELL) populations, with Spanish being the most common primary language. Additionally, all programs mainly served lower income students.

Measures/Instruments

Based on the theories and indicators of the theoretical logic model described in Chapter 2, a more content focused validation model was designed to provide a structural framework for instrument development, examination of specific content practices, and data analyses for this study (see Figure 2).

⁷ On ten site visits, the site visit team found upon arriving at the program that only one site was willing to participate or, in fact, a program was so small that only one site was visited.

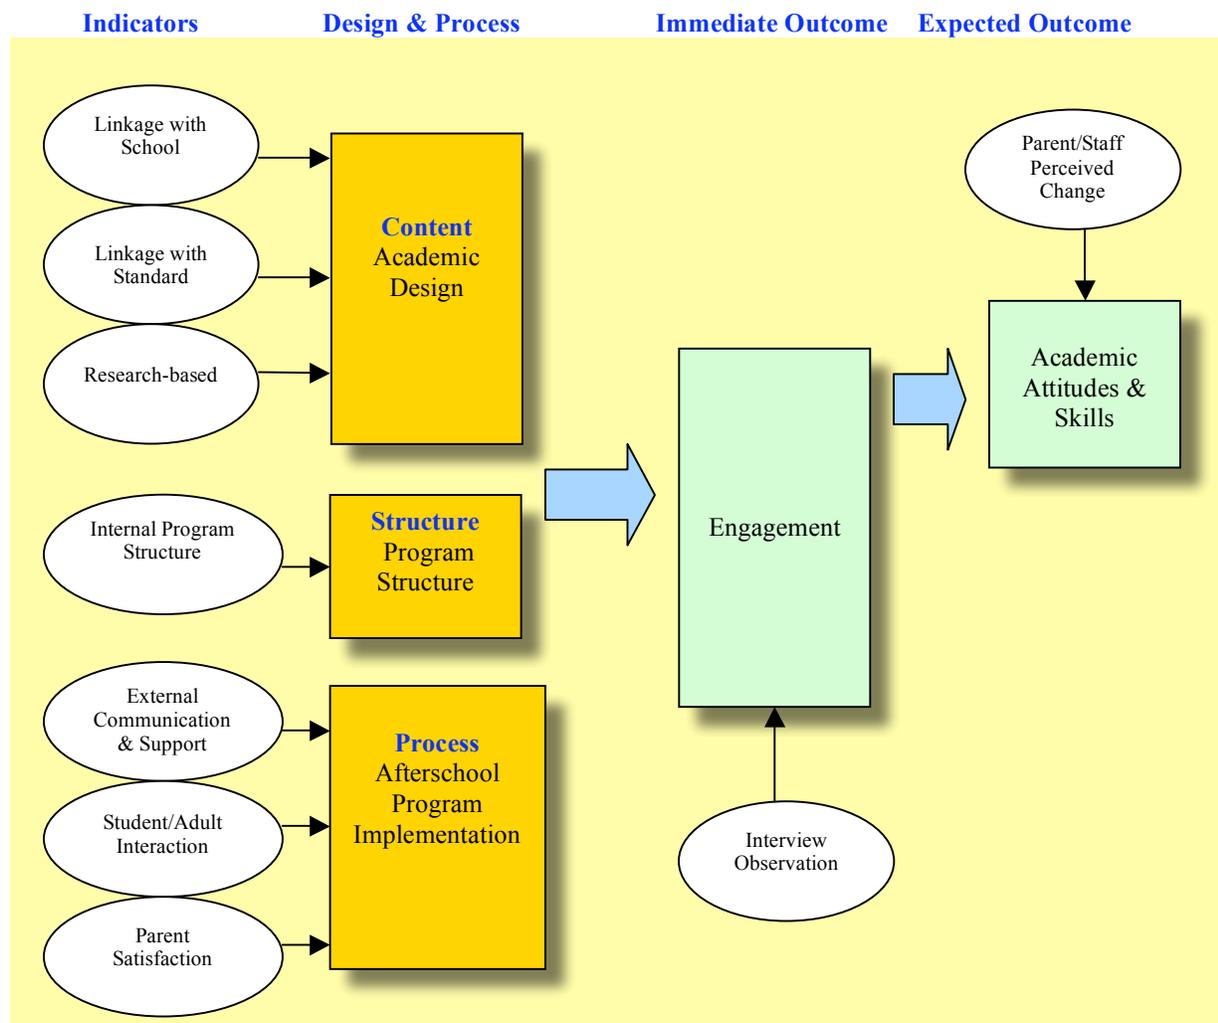

Figure 2. Validation model.

As shown in the validation model, high quality content practices are expected to show strength in their curricular content as indicated by linkage with day school, standards, and research-based practices. The internal program structure is indicated by program organization, duration and frequency of instruction, staff experience and education, governance/leadership, and professional development. The program process is indicated by external communication and support, student/staff interaction, and parent satisfaction. The main focus of this study was on program content, and examined how program process can enhance curricular content and student engagement in math, literacy, science, arts, technology and homework (see Appendix A for content specified models).

Based on the content specified models, CRESST developed the data collection instruments. Different versions of the instruments were created to cover the six content areas. The following is a brief overview of these qualitative measures:

- **Staff Survey:** The staff survey was administered to participating afterschool program site coordinators and instructors. The survey included questions about content-specific curriculum, general instructional practices and activities, and organizational or structural characteristics.
- **Parent Survey:** A survey was distributed to parents of the afterschool students. Items focused on perceived program satisfaction, opportunities for parental involvement, as well as student impact.
- **Teacher Survey:** A survey was distributed to day-school teachers whose students were also in the afterschool program for Years 2 and 3.⁸ Survey questions asked about their knowledge of the afterschool curriculum, as well as perceived changes in student attitudes, knowledge, and performance due to participation in the program.
- **Interview Protocols:** Various forms of the interview protocol were developed for project directors, site coordinators and site instructors to specifically address questions that were most relevant to the interviewee. The interview questions gathered information on the general nature and structure of the afterschool program to better identify the qualities of a promising practice program. The interview protocols covered a number of areas including general program background information, content area instructional strategies and other student-based activities, program organization and structure, external communication and support, student-adult interactions, and program outcomes and impact on students.
- **Observation Protocol:** A structured observation protocol, including both content-specific and general instruction items, was used to document program and lesson implementation as well as program structure and classroom climate. The protocol included scales, checklists, and open-ended questions focused on the content and quality of afterschool instructional practice.
- **Site Summary Report:** The site visit team completed a site summary report based on a template CRESST provided. The information in these site reports was used to supplement and triangulate with the other data sources.

CRESST conducted a 2-day professional development for the National Partnership staff and content focus team consultants who conducted the site visits. The first professional development occurred in March 2004 at the UCLA campus and additional development was provided via teleconference for new site visit staff later that year. For Years 2 and 3, CRESST provided training via teleconference only. The professional development covered:

- Pre-site visit preparation activities
- Understanding of site visit organization and scheduling

⁸ Teacher surveys were not utilized for Year 1 due to scheduling conflicts.

- Survey collection
- Use of interview and observation protocols
- Collection of archived data
- Debriefing/completing site visit reports

Data Collection and Analysis Methods

Both quantitative and qualitative methods were used to collect and analyze data from the sample programs. A site visit plan was developed for each site. Surveys, interviews, and observations at each site were completed. CRESST provided a program-level checklist to guide the collection of all data and any additional information shared regarding the program.

Surveys

All surveys were distributed to the programs prior to the site visits. The programs assisted in the administration of the survey instruments, which were collected by the National Partnership team at the time of the site visits. Surveys were administered to all parents of afterschool students, day-school teachers whose students were also in the afterschool program, and afterschool program staff including site coordinators, instructors, program workers, playground workers, activity coaches, partner organization staff, program experts, counselors, and volunteers. Completed surveys from each program were returned to CRESST and results were entered into an SPSS statistical software program. Frequencies and means were calculated according to indicator variables (e.g., program structure, linkage to the day school, professional development). These results were triangulated with the qualitative data to help provide further evidence of promising practices.

There was substantial variance in the number of surveys administered and response rates across the 53 programs. Afterschool staff members responding ranged from 70 to 233, parents responding ranged from 154 to 1000, and day-school teachers responding ranged from 62 to 150 across the different content areas (see Table 3).

Descriptive statistics were used to present the frequencies and means of the survey responses. Exploratory factor analyses were conducted and constructs were extracted from the surveys as well as from the APR/PPICS data on teacher surveys used for the purposes of program identification. It is also important to note that some content areas were underrepresented or heavily represented due to the varying response rates across the programs.

Table 3
Survey Response Rate

Content area	Afterschool staff surveys	Parent surveys	Day-school teacher surveys
Math	74	377	NA ¹
Literacy	233	1000	NA ¹
Arts	82	254	62
Science	103	496	150
Technology	70	319	105
Homework	83	154	107
<i>Total</i>	<i>645</i>	<i>2600</i>	<i>424</i>

¹ Teacher surveys were not administered in Year 1.

Interviews

Project directors, site coordinators, instructors and other afterschool program staff members⁹ who volunteered to participate in the study ($N = 338$) were interviewed face-to-face by at least one National Partnership site visit team member. The interviews lasted approximately 1 hour. Table 4 illustrates the number of interviews conducted per program.

Table 4
Number of Interviews by Position

Content area	Project director interviews	Site coordinator interviews	Instructor interviews	Other interviews	Total
Literacy	11	16	30	6	63
Math	7	14	21	5	47
Arts	9	16	31	15	71
Science	9	13	23	11	56
Technology	8	15	26	5	54
Homework	10	14	19	4	47
Total	54	88	150	46	338

Interviews were audio taped to ensure data accuracy, although participants were given the option to decline having their interviews recorded, none did. Interview questions were focused on topics related to (a) professional background and/or professional development

⁹ Including project managers, academic and community liaisons, community partnership managers, school day principals, tutors, etc.

and experience with afterschool programs; (b) program content knowledge, curriculum, and instructional methodology specific to instructional practices in the six content areas; (c) internal site structure and organizational characteristics of the afterschool programs; (d) external instructional communication and support; and (e) program evaluation and areas of perceived program impact. The interview protocol varied slightly depending on the interviewee’s position. For example, project directors were not asked questions specific to curriculum implementation or instructional strategies, while instructors were. The site visit team also had the option of conducting additional interviews depending on the specific program or site, such as with the day-school principal or other district staff.

Once the taped interviews were completed and transcribed, CRESST researchers entered the data into the Atlas.ti statistical software package to code the interviews. Codes and sub-codes were then created using an inductive approach to analyze the data. A general review of the transcripts informed the development of an initial code set that reflected salient concepts and common responses across programs, sites, and respondents. Researchers used the initial code set to qualitatively analyze a small subset of interviews. Upon completion of these tasks, researchers condensed initial codes and developed additional codes to better reflect the data. Coding reliability was attained through researcher consensus.

Observations

On average, National Partnership site visit team members observed two instructors per site (see Table 5). Site visit teams prepared site summary reports based on a template developed by CRESST to provide relevant information observed during their site visit experiences. These reports, additional field notes, and any supplemental materials collected were sent to CRESST and used to further triangulate the findings.

Table 5

Arts	9	16	48
Science	9	18	32
Technology	10	14	31
Homework	7	14	25
Total	53	96	104

CHAPTER 4: INTERNAL PROGRAM STRUCTURE

This chapter provides descriptions on the internal program structure of the 53 programs in this study, including details about program organization, program governance and leadership, duration and frequency of instruction, staff education and experience, professional development opportunities, and program resources. Survey and interview data were used to capture commonalities and differences among the 53 programs, and to extract practices that appeared to align with quality afterschool programming.

Program Organization

Across all program content areas, afterschool staff members were asked to rate their program's organization on a scale of 1 to 5, 1 indicating "Strongly Disagree" and 5 indicating "Strongly Agree." In general, the staff across all 53 programs offered high ratings for topics related to program organization. They expressed high levels of agreement with the following statements (mean level of agreement above 4.0): students understand the standards for behavior; programs address students' behavioral issues promptly; and program has adequate materials and resources. Survey results also indicated that staff members felt they had a voice in curriculum development and received adequate support from their supervisors. Fewer staff members responded they met with each other regularly to discuss the curriculum. Interview data further revealed that almost all programs conducted biweekly or monthly staff meetings, but meetings specifically focused on curriculum content were conducted less often.

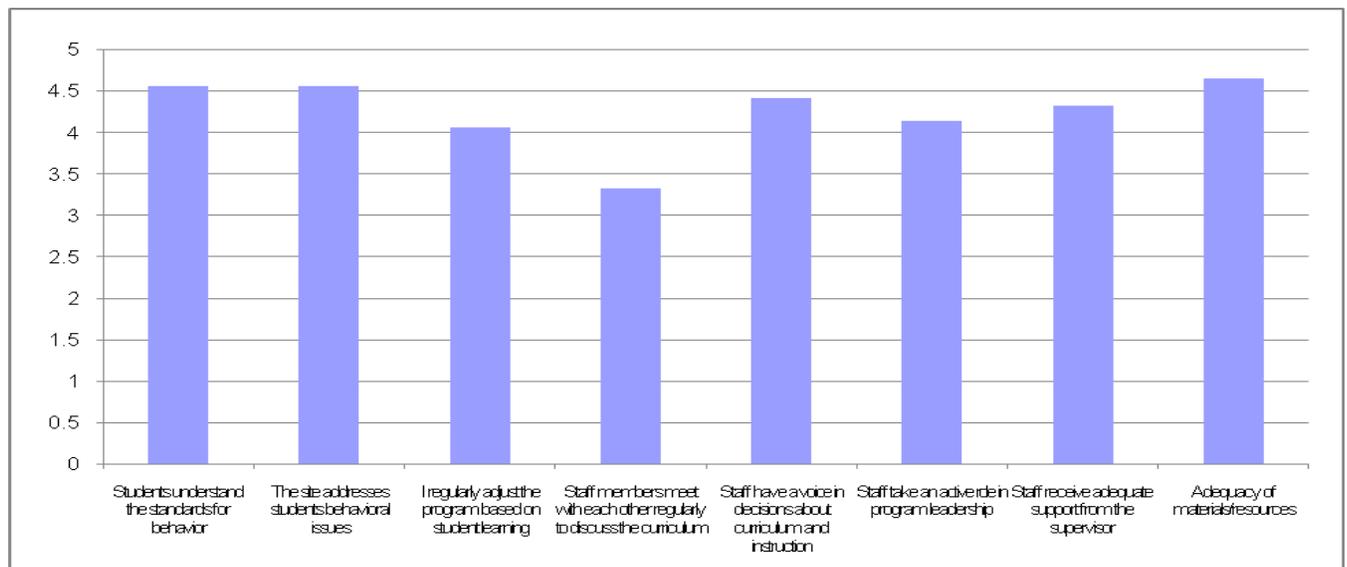

Figure 3. Mean scores on program organization survey responses.

Student Discipline

In addition to asking program staff about their students understanding of afterschool standards for their behavior (mean level of agreement = 4.4), they and other study participants noted minimal disciplinary issues for the 53 programs. Moreover, staff members, on average, strongly concurred with the statement that their site addressed student behavioral issues in a timely and consistent manner (mean level of agreement = 4.5). Site summary reports supported these findings, with site visit teams observing that the overall classroom climate in these programs was positive, staff-student relations were nurturing, staff and student expectations for success were high, and disciplinary concerns were minimal.

The degree of specificity described by programs regarding their approach to discipline varied somewhat. Some programs provided specific examples of behavior problems and how they would be addressed, while others provided fairly general descriptions of their disciplinary policy. Programs also varied in their level of adherence to the day-school discipline policy. Several programs adopted the same disciplinary system used by the day schools they served. Others seemed to believe that afterschool discipline policies should be slightly more lenient than the day-school policies, given the students' energy level and attention span after a full day of school. For instance, one afterschool art instructor stated that she "encountered less behavioral problems than day-school teachers because her students responded better to the lenient atmosphere of the afterschool program."

Program Governance/Leadership

Afterschool programs are often characterized by the degree to which they adhere to a specific decision-making structure. Generally speaking, those with a centralized leadership style reserve the majority of the decision-making authority for upper management, while programs with a decentralized structure are more democratic, allowing and sometimes encouraging participation by a wider circle of stakeholders. Although both leadership styles can be productive, an indicator of high quality afterschool practice involves shared leadership and decision making.

In the 53 programs in the sample, triangulation across survey, interview, and observation data regarding decision-making processes was consistently aligned. The majority of both site coordinators and instructors at all programs indicated in their survey responses that afterschool instructors had an active voice in decisions about curriculum and instruction (mean level of agreement = 4.4), and took active roles in program leadership and decision-making (mean level of agreement = 4.1).

The amount of ownership instructors felt toward decision making seemed to be related to the kind of program culture and expectations conveyed to them by site coordinators and project directors. Some site coordinators appeared to be stricter than others in maintaining their authority over the decisions made at their sites. But in the majority of cases, site coordinators and project directors acknowledged the importance of their instructors to the day-to-day operations, especially when they considered the instructors' familiarity with the students and their needs. Interviewees at most programs reported that instructors' input was highly valued and frequently determined the end result, as instructors were considered the "experts" in their content area. An instructor of an arts program explained,

My experience has been that the afterschool teachers propose something that we'd like to do with the kids after school, and [the director] then just talks to us about what our plans are. We kind of report to her in terms of lesson plans and how we incorporate standards and benchmarks, but a lot of freedom is really given to us. We teach what we're comfortable teaching and what we're passionate about.

One site coordinator expressed appreciation for the staff by stating, "These are professional adults . . . and they are the best ones to implement the curriculum, because they see. They're with the students, right there with them, and they know what their levels are and what their abilities are."

In the case of programs where decision making was characterized as decidedly decentralized or "democratic," administrators consistently described the value of staff's content-specific skills and expertise, and as a result, curriculum development was more of a group process in which staff members were given a great amount of leeway in designing instruction. A project director at a technology program clarified that the latitude his staff had was evenly balanced by a strong level of accountability for their curricular choices.

Obviously, we try to be more democratic. . . . So one of the things we try to do here, how we want to make this a great place to work, is in finding great people, then giving the people the power and leeway and the accountability, but also the freedom to do what they think works best, and trusting them. . . . Every quarter they have to come back to us and tell us how they're doing. They report back as to what is going on at their . . . programs. In terms of actually decision making and setting goals and deciding what we're going to do, that's much more of a bottom-up process.

Overall, data across programs indicated that whether decision-making regarding curricula design followed a top-down or a more collaborative model, it was very often guided by levels of expertise among staff members.

Adequacy of Space and Resources

Program staff members were also asked about their needs in terms of resources (i.e., supplies, staff, space, etc.) in the afterschool program. Consistently across programs, site coordinators and program staff commonly mentioned a need for additional space. Many programs seemed to rely on access to common space, such as an auditorium or a classroom shared with day-school teachers, which often caused logistical problems and sometimes prevented planned activities from taking place. Furthermore, some programs expressed difficulty with not having consistent access to classrooms. A site coordinator illuminated the problem, “I would say physical space would be definitely a big thing with our program . . . that is probably one of the hardest things to work with just because every 6 weeks we are readjusting the classroom to new classroom seating charts, new areas in which the students can and cannot go.” Additionally, several interviewees commented on the need for a separate office and storage space.

According to most programs, another scarce resource was access to technology and particularly computers. Although all the technology programs in this study indicated they had sufficient computers and tools to work with (it should be noted here that many technology programs were funded by, had a partnership with, or received support from technology companies such as Dell, Apple, etc.), other programs were frustrated by old equipment and a lack of current software. While survey results indicated most of the programs had sufficient materials and supplies to work with, a few interviewees also requested more access to textbooks, literature, and general supplies. Site coordinators at a few programs also indicated that they would utilize additional funds they raised through fund-raising and other activities not only to purchase supplies, but also to hire staff with expertise in the field of education or social work due to program popularity and growth.

Opportunities for Practice

The internal structure of an afterschool program is also impacted by the instruction provided to its students. Miller (2003) states that successful afterschool programs provide activities that enable students to gain knowledge and to practice knowledge learned in school, as well as opportunities to reflect, make decisions, and solve problems. Similarly, the U.S. Department of Education and U.S. Department of Justice (2000) found that students need the opportunity to practice and develop their literacy skills through intelligent discussions with adults and peers, storytelling, reading and listening, games and other activities.

Duration and Frequency of Instruction

The duration and frequency of instruction offered at the identified programs was also studied to understand the instruction time and opportunities to practice students were receiving as part of the program's organization. Most of the 53 programs operated 5 days per week. The majority of programs reported offering three or more activities each day. Most included some kind of homework help or tutoring as part of their programs, but other activities offered ranged from academics (e.g., math, literacy, writing, science) to non-academic enrichment (e.g., arts and crafts, cooking, gardening, health and nutrition, cultural activities, computers) and recreation (e.g., sports, dance, drill team, outdoor games).

The duration of content specific instruction reported by interviewees varied from 45 minutes to a little over 1 hour per session, as seen in Table 6. All programs offered their content-specific instruction at least two times a week. Homework programs reported having the least number of minutes (45 minutes) dedicated to homework assistance on a daily basis. However, these programs also offered homework help more frequently (4 days a week) than the other content areas. Technology programs reported having the most number of minutes (105 minutes) dedicated to activities using or teaching technology and offered technology instruction an average of nearly 4 times per week. Technology instruction was unique from the other content areas since, while it was often taught as a discreet course, it was also consistently integrated into other content areas. For example, the afterschool staff reported using technology on a regular basis for academic instruction, as well as during enrichment and recreation activities. Students were receiving additional exposure to the academic instruction and were given time to practice their skills. Site summary reports across the programs also indicated that site visit teams observed that students were mostly engaged and attentive, and enjoyed the activities.

Table 6
Duration and Frequency of Instruction by Content Area

Content area	Average duration of daily instruction	Number of days offered per week
Literacy	51 min.	3.20
Math	66 min.	2.58
Science	77 min.	2.28
Art	77 min.	3.72
Technology	105 min.	3.55
Homework	45 min.	4.00

Staff and Staff Development

Scott-Little, Hamann, and Jurs (2002) state that successful afterschool programs are characterized in part by having well-qualified and well-trained staff. Fashola (2002) notes, “Academic subjects taught during the afterschool period require qualified, preferably certified, instructors familiar with and who can be held accountable for student outcomes” (p. 60). Similarly, the U.S. Department of Education and U.S. Department of Justice (2000) believe that it is important to provide professional development to staff members to increase their ability to develop and implement developmentally appropriate curriculum; improve their skills in supporting and encouraging curiosity and exploration; support their function as role models; foster their ability to instill a healthy self-image in students; and to more generally attract and retain high quality staff members.

Professional development can also give employees ideas for enrichment and hands-on activities, greater expertise in academic subject matter, knowledge in assessing student progress, and strategies for the different program components of academics, enrichment, and recreation. Staff education, professional development, and attitudes are thus important program features in afterschool settings.

Staff Experience and Education

Through interviews and surveys, site coordinators and instructors at the 53 programs in the study sample were asked about their overall experience with afterschool programs and their qualifications. Responses gathered from all the content-specific programs were very similar. Of the 150¹⁰ program staff members for whom these data were available, the majority (43 percent) had experience in afterschool for 3 to 5 years. In general, survey results were compatible with the interview data, although interview data tended to indicate slightly higher levels of staff experience. The results for instructor experience are displayed in Table 7.

¹⁰Number of instructors by content area: Literacy $N = 30$, Math $N = 21$, Arts $N = 31$, Science $N = 23$, Technology $N = 26$, and Homework $N = 19$.

Table 7
 Staff Experience in Afterschool ($N = 150$)

Years experience in afterschool	Instructors
Less than 1 year	13%
1 to 2 years	15%
3 to 5 years	43%
6 to 9 years	14%
10+ years	9%
Did not report	6%

In addition to overall experiences in afterschool programs, program staff members were asked about their experiences at their current site. The majority of the staff stayed over 3 years. Math and literacy program staff members had an average of 3.5 years of experience at their sites. Forty-six percent of staff in the science sites, 42 percent in the arts sites, and 38 percent in the technology sites worked over 4 years at their sites, with 75 percent had been at their sites for at least a year. Thirty percent of staff in the homework programs had from 4 to 7 years experience at their sites and 60 percent had been with there for at least a year. Since staff stability is important for relationship building, especially for at-risk students, the length of time staff stay in a program is important. These staff can serve as constant figures and mentors in their students' lives and their relationships can provide the basis for students to build trust, character, and efficacy, which are all essential elements for good citizenship (Huang et al., 2007; Huang et al., 2006). Specific percentages for staff experiences at the sites are available in Appendix B.

Program staff members were also queried about their educational qualifications. As seen in Figure 4, of the 78¹¹ staff members that responded, 52 percent reported some type of teaching certification, credentialing, or degrees (e.g., credential, bachelor's or master's degrees). Programs that were district affiliated responded that most or all of their staff members were certified teachers, often at the school where the students also attended afterschool. At these programs, some teachers also held additional credentials such as English as a Second Language (ESL), literacy, math, or special education specialists. Community-based programs generally hired from the community, having few certified

¹¹ Number of instructors by content area: Literacy $N = 8$, Math $N = 11$, Arts $N = 13$, Science $N = 17$, Technology $N = 15$, and Homework $N = 14$.

teachers with staff members typically community members or college students. These findings also support the results from the day-school teacher surveys.

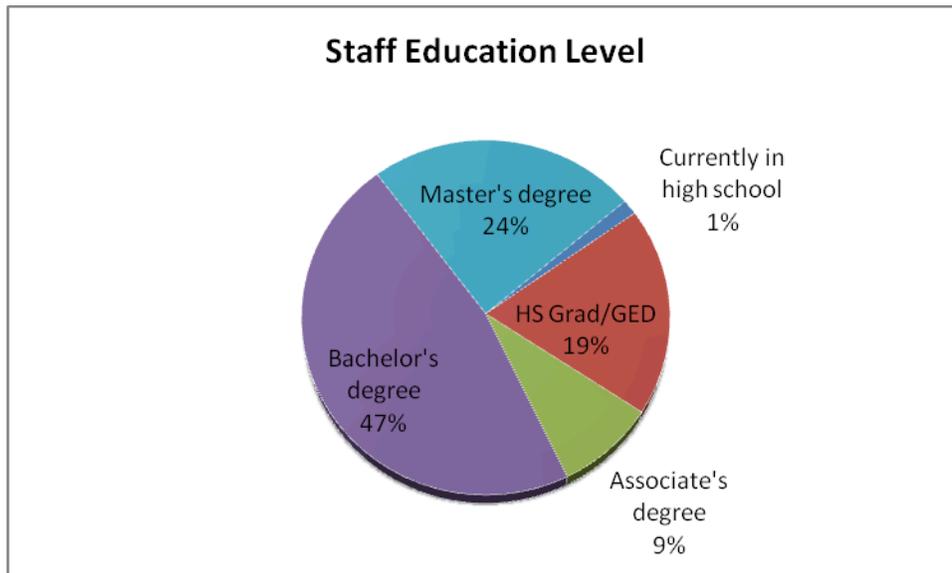

Figure 4. Instructor education based on staff survey data.

The majority of program staff reported having a bachelor’s degree (47 percent), while 24 percent had a master’s degree. In terms of content-specific areas, nearly 45 percent of the math and literacy instructors reported having a bachelor’s degree, and approximately 20 percent had earned a master’s. Similarly, the majority of arts and science instructors also reported having a bachelor’s degree (34 percent and 56 percent, respectively), and 28 percent of the arts instructors and 36 percent of the science instructors reported having earned a master’s degree. In addition to a bachelor’s or master’s degree, 10 percent of arts instructors and 14 percent of science instructors also had obtained a teaching credential. As for technology and homework program staff, the majority of technology instructors received an associate’s degree (46 percent) or a master’s degree (31 percent), while 23 percent had earned a bachelor’s degree. The majority of homework instructors received a bachelor’s degree (36 percent) or a master’s degree (28 percent), while 16 percent of the homework instructors had also received a teaching credential. Compared to the general afterschool field, the educational level of these afterschool staff members is high.

Types of Professional Development

The most common types of professional development offered across programs were general techniques in working with students, such as classroom management, discipline issues, social issues (e.g., cooperation or bullying); and general teaching strategies. A few programs had professional development that was tailored to the specific needs of their

student population. For instance, one program provided professional development on gang awareness/prevention, and a couple others focused on preparing staff to serve students with special behavioral needs such as ADHD, or academic needs related to second-language issues. Two science programs offered professional development on child abuse and poverty, some math and literacy programs offered trainings on helping students in their specific content areas, and others had staff development for integrating technology and computers. Some programs also provided instructors with professional development on how to motivate and connect with students.

Although all interviewees reported having some sort of professional development available through their afterschool program, most program staff members received the bulk of any formal or semi-formal content-specific professional development through the day school or the district. More specifically, the district-affiliated programs generally encouraged staff to attend district professional development together with the day-school teachers. Among the six content areas, the technology program was the one that offered professional development to their staff consistently. One technology program director reported offering “extensive, rigorous, and regular technology professional development” exclusively to afterschool staff (i.e., not affiliated with the day school or the district). Staff at the majority of technology programs supplemented staff development with self-sought or peer-to-peer technology professional development.

When opportunities were available and staff participated in the professional development, they generally found it useful. Instructors particularly appreciated professional development that was directly applicable in the classroom, relating to teaching strategies, innovative approaches and classroom management. As one program staff explained, “That’s the best part—that we can actually incorporate it. You don’t just learn it to say you know it, but to actually do it with students.”

Afterschool staff responses also indicated that professional development aided in practical knowledge that led to promotion. Some characterized professional development as a means of realizing long-term professional goals, as illustrated by one program staff,

It has definitely been one of the most beneficial things that we have. I believe that it has helped our staff members grow as far as within the program and for their own development. Most of the staff members that I’ve worked with or that I’ve known usually want to become teachers and so this is a great stepping-stone for them.

Staff Participation in Professional Development

Although opportunities of professional development were offered to the program staff, they did not necessarily participate in it (see Tables 8 and 9). Fifty-seven percent of the staff reported their programs offered professional development from two to four times a year; however, only 26 percent participated this many times a year. Sixty percent of the staff reported that they never participated in the professional development offered through their programs, and 14 percent reported that they participated once. When the data was analyzed by content area, the highest participation rate was from the technology staff; 50 percent indicated that they had participated in professional development two or more times a year while 42 percent responded that they had never participated in professional development for technology instruction.

Table 8
Professional Development (offered by site)

Frequency	Percent
Never	18%
Once	12%
2–3 times	22%
4 times or more	35%
Don't Know	13%

Table 9
Professional Development (participated by staff)

Frequency	Percent
Never	60%
Once	14%
2–3 times	17%
4 times or more	9%
Don't Know	0%

Notably, project directors and site coordinators seemed to report higher frequencies of participation in professional development activities than the program staff. Several explanations were gleaned from the data. First, some project directors were not clear in

differentiating the professional development that was offered to site coordinators and other members of upper management, as opposed to program staff at sites. Second, it seemed that program staff had a more rigid definition of what counted as formal professional development, whereas many site coordinators counted weekly staff meetings as professional development. At the same time, it also appeared that site coordinators and administrative staff, often district level, generally received the majority of the off-site professional developments.

Variations in Professional Development According to Content Areas

The types of professional development offered at the afterschool programs also varied according to their content focus. Most professional development opportunities offered were on helping students with literacy and math, applying state standards to the curriculum, and connecting with the day school. Fewer opportunities were offered on working with ELLs, self-evaluation, and assessment.

Math and literacy program staff cited similar types of professional development offered at their afterschool programs. Figure 5 shows, similar to the interview findings, that a higher percentage of site coordinators in literacy and math programs reported receiving professional development in most categories (other than working with ELLs). Instructional staff in these programs reported receiving less professional development in program and self-evaluation. Similar trends were observed for science.

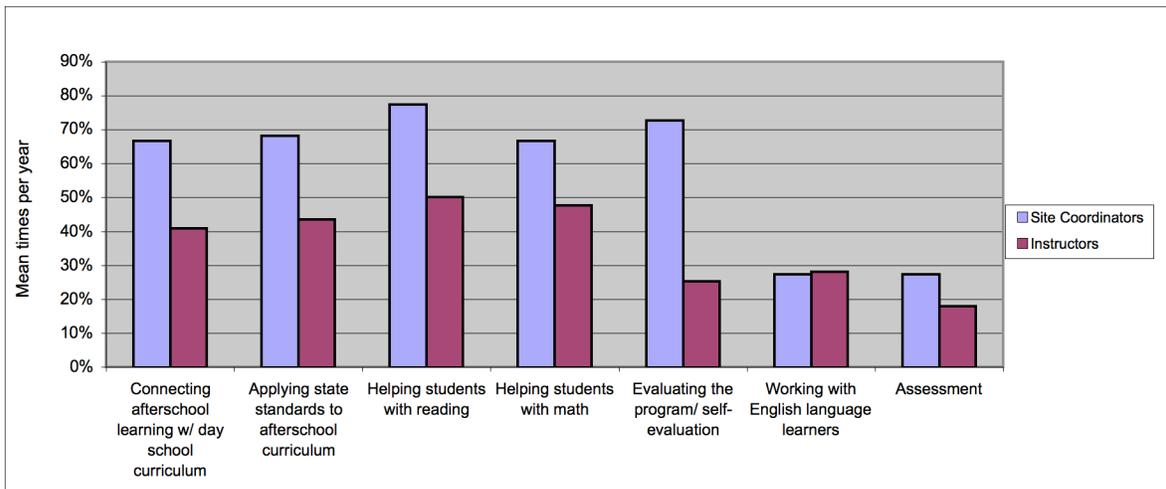

Figure 5. Types of professional development offered to math and literacy programs.

Professional development specific to the arts ranged from an artists’ retreat where instructors could share their work and discuss best practices, to dealing with conflict

resolution and how it relates to the arts, to staff development on specific topics such as music, dance or paper-making. More specifically, the majority of art instructors (59 percent) indicated that they received professional development on helping students with art projects. It should be noted here that 5 out of the 9 arts programs had local partnerships with arts studios and experts that served as instructors for these programs.

More than half of the staff interviewed at the nine science programs (69 percent) reported that professional development was offered regularly at their sites. The types of professional development offered across programs focused mainly on coverage of science curriculum and instruction. Specific professional development sessions ranged from week-long science workshops to creative ways of exposing children to science through play and exploring, including new ways of teaching different areas of science and staff development on specific topics such as pollution and the environment, chemistry, and earthquakes.

The majority of the technology programs reported that implementing or maintaining regular professional development sessions was a goal of the program. All interviewees reported having some sort of technology-related professional development available through their afterschool program. However, it should be noted that at six of the 10 programs, staff received the bulk of any formal or semi-formal technology professional development through the day school or the district. A good number of interviewees sought professional development on their own (e.g., through conferences or online), and many also received technology instructions from more knowledgeable colleagues in the afterschool.

Meanwhile, about 50 percent of the homework program staff reported that no professional development was offered to them. Of those who received professional development, 28 of the program staff indicated that they received professional development on evaluating the program and self-evaluation. Twenty-two percent of the staff responded that they received professional development on connecting afterschool learning with day-school curriculum, and 20 percent of the staff reported receiving professional development in techniques for helping with homework.

Summary of Internal Program Structure

The internal program structure of these 53 programs followed a similar pattern. Programs were generally well managed, usually under strong leaders who were able to articulate a clear program mission and vision statement and goals, and were able to empower and motivate the staff to achieve the program objectives. The students appeared to understand the codes of conduct for behavior; when necessary the programs addressed

students' behavioral issues promptly. These programs also had adequate materials and resources.

Program staff felt they had a voice in curriculum development and received adequate support from their supervisors. In the majority of programs, site coordinators and project directors acknowledged the importance of their program staff to the day-to-day operations, especially when they considered the program staff's familiarity with the students and their needs. This trusting relationship empowered the staff to set high expectations for their students and develop efficacy in their instructional activities. The team culture that existed in most of the programs indicated that positive relationships and communication among the afterschool staff appeared to enhance their ability to expand their roles; and the frequent interaction among program staff also appeared to have a positive impact in fostering problem solving, thus decreasing the level of assistance sought from the site coordinator.

As for scheduling, the duration of content specific instruction reported by interviewees varied from 45 minutes to 1 hour and 45 minutes per session. All programs offered their content-specific instruction at least two times a week. Technology programs reported having the most number of minutes (105 minutes) dedicated to activities using or teaching technology and offered technology instruction an average of nearly four times per week. Technology instruction was unique from the other content areas since, while it was often taught as a discreet course, it was also consistently integrated into other content areas. For example, afterschool staff reported using technology on a regular basis for instruction in academic content areas (e.g., math, literacy, writing, science), as well as non-academic enrichment (e.g., arts and crafts, cooking, computers) and recreation (e.g., sports, dance, outdoor games). These findings suggested that students were receiving adequate exposure to the instructions and were given time to practice their skills. Across the programs, students appeared to be mostly engaged attentive, and enjoying the activities.

On average, the staff in the 53 programs came with 3 to 5 years of afterschool experiences and had low turnover rates, with an average of 3.5 years working at their current sites. Most of them also came with either a bachelor's or master's degree, especially for the science, arts, and technology programs.

In general, all programs offered professional development at least once or twice a year, but staff participation was low. Many staff indicated they never or rarely participated in professional development offered by their program. Technology programs had the highest participation rate, with the majority of technology programs emphasizing the importance of following the recent developments in technology. Of the professional development offered,

all programs described training on student discipline and classroom management. School district-related programs tended to provide greater opportunities and varieties for professional development, having the afterschool staff participate in the professional development together with the day-school teachers. Participation in this type professional development was generally higher. When the program staff did participate in professional development, they generally reported it was useful, especially when the professional development sessions were directly applicable to the afterschool classrooms.

CHAPTER 5:

PROGRAM PROCESS

This chapter provides an overview of the process for program implementation at the 53 programs. Descriptive findings on parent participation, connecting with the community, staff-student interaction, and student engagement in terms of opportunities for practice, social development, and motivational support are included in this chapter.

Parent Involvement

Parent involvement is an essential indicator in external connection and support for high quality practices in afterschool programs. Site coordinators in the study sample were asked in interviews and surveys about their perceptions of parental involvement in the afterschool programs. Distinct themes emerged across both survey and interview data for all 53 programs with very few exceptions or variations. Most programs shared similar methods of disseminating information to parents, as well as means of encouraging their involvement in the afterschool programs. However, despite great efforts in these areas, almost all programs showed evidence of fairly low parent participation or volunteerism, as well as low percentages of formal parent-teacher meetings. Most of the programs did not have a formal structure in place for scheduling regular meetings with parents. Parents expressed satisfaction with the programs, some mentioned close involvement with their child's afterschool program, while others only received information from the program.

Sharing Information and Promoting Participation with Parents

Site coordinators and program staff across all 53 programs consistently offered a broad range of means by which they shared program and student progress information with parents. Some of the most frequently cited means of communication were: 1) monthly/semimonthly newsletters; 2) pre-academic-year orientation; 3) parents' nights; 4) community outreach activities, such as potlucks and student performances; 5) afterschool nights throughout the academic year; 6) letters, notes and phone calls home as necessary regarding student progress, attendance, or behavioral issues; and 7) scheduled meetings with site coordinators or program staff as necessary.

Survey results indicated parents' perceptions of program efforts to share information and promote participation were generally favorable (see Figure 6). Overall, responses indicated that parents felt the programs made an effort to keep them abreast of program rules and practices, and to encourage their participation. About 20 percent of parents indicated that the program never invited them to volunteer in the afterschool program, but nearly 40 percent

indicated that they were invited to volunteer at least once a month. About 35 percent of the parents surveyed stated that their children’s afterschool programs provided program information in their home language at least once a month.

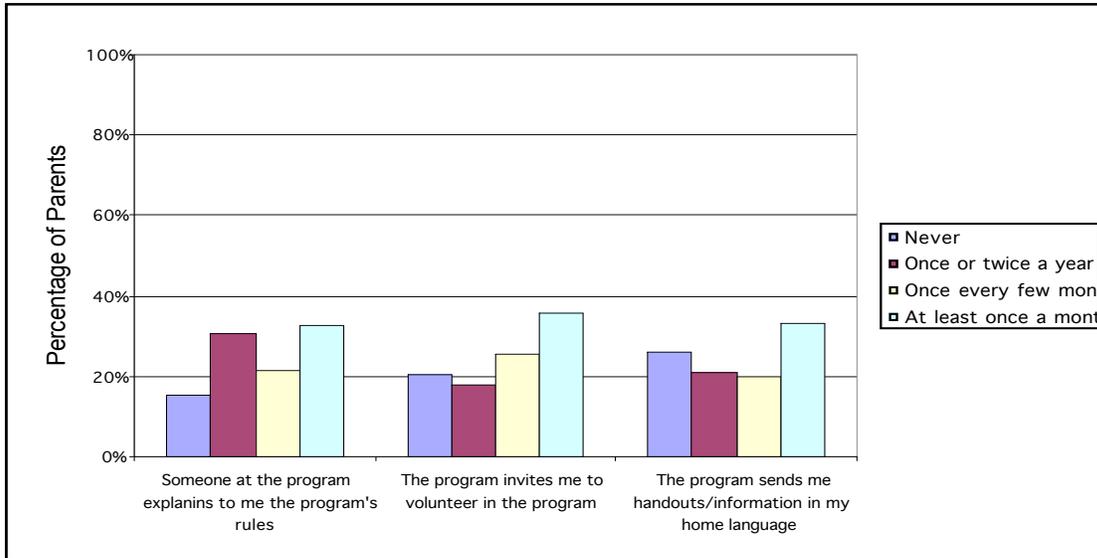

Figure 6. Parent awareness of the afterschool program.

Interview data indicated that in over half of the programs all parents were encouraged to volunteer at their sites in some capacity (e.g., in the classroom, on field trips, chaperoning events), and a few sites offered weekend parent workshops (e.g., crafts, cooking, ESL, or GED courses). Despite these efforts, actual parent involvement, including volunteerism, was extremely low or nonexistent across the programs. Parent survey results, as shown in Figure 7, confirmed that the frequency of parent participation was low across all programs. Staff identified the key reason was that their programs predominantly serve families where both parents work and thus are unavailable to attend afterschool activities on a regular basis, if at all. As one program staff at a homework program explained,

A lot of them [parents] are interested to know what’s going on . . . but as far as coming in and checking it out, it is a very small percentage. They do get the newsletters and the calendars so they do know what we’re up to. Most parents [however] are working at that time; so it makes it hard for them.

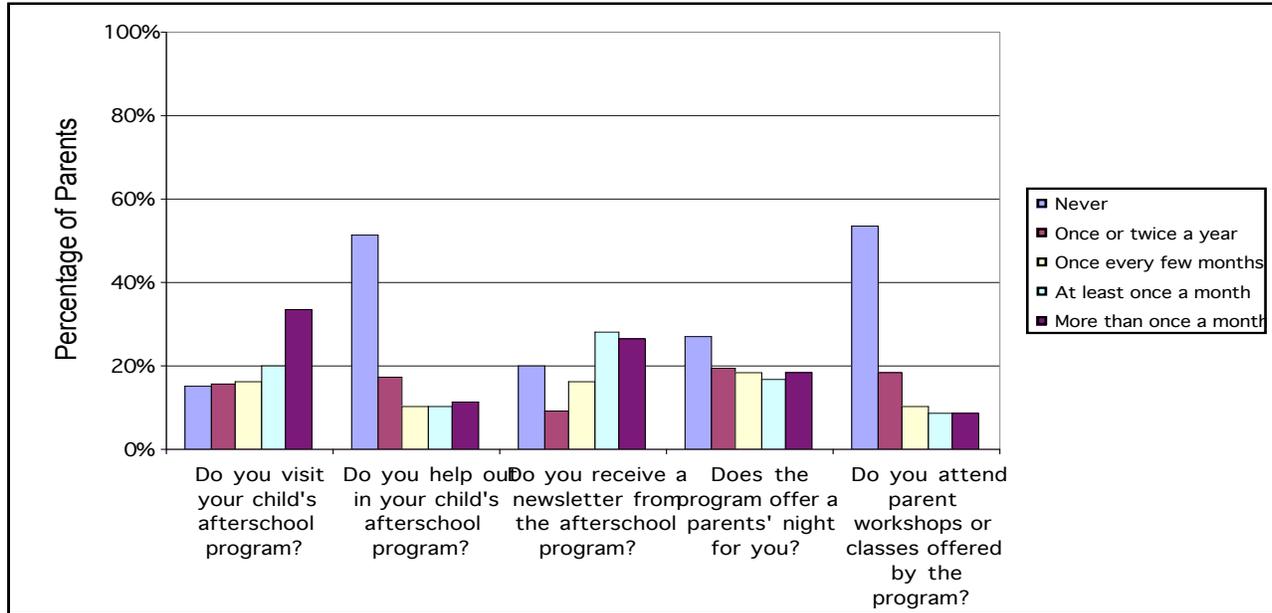

Figure 7. Parent involvement at the 53 programs.

More than half of parents reported receiving frequent, once a month or more, newsletters from their children's afterschool programs. However, slightly more than half of parents stated that they never helped out at their children's afterschool programs; and the same percentage reported a failure to attend parent workshops or classes offered by the program.

Parent Meetings

Survey results also suggest that afterschool staff did not meet with parents on a regular basis. As shown in Figure 8, afterschool staff across the programs reported infrequent meetings with parents. Almost 50 percent of the staff said that they never or rarely had formal meetings with the parents, only 19 percent of staff met with parents on a regular basis.

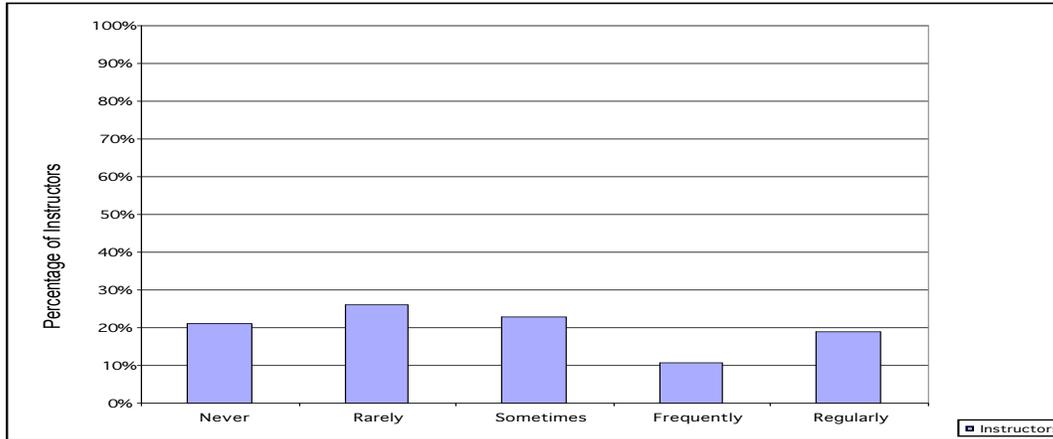

Figure 8. Frequencies of parent meetings at the 53 programs.

Interview responses regarding formal parent meetings with afterschool staff indicated a similarly low occurrence. While some programs had a formal parent meeting scheduled at the onset of the school year (typically a group orientation rather than a one-on-one meeting), a significant number of afterschool staff stated that they rarely, if ever, met formally with parents. However, almost all staff in the 53 sites mentioned that they frequently took the opportunity to speak and discuss student issues with the parents when they picked up their children in the evenings.

Parent Perception of the Program

Although formal meetings and involvement with parents were rare, the parents' perceptions of the program were very high (see Figure 9). Ratings were based on a 10-point Likert scale (1 being never, 10 being always). Parents indicated they felt welcome to visit their children's afterschool programs at any time, and that there were staff members available to speak to them in their home language. They felt comfortable talking about program materials, and felt the staff cared about and respected their children. They also reported that afterschool staff dealt with their children's behavioral problems promptly, and that they were notified in a timely manner if their children were not paying attention.

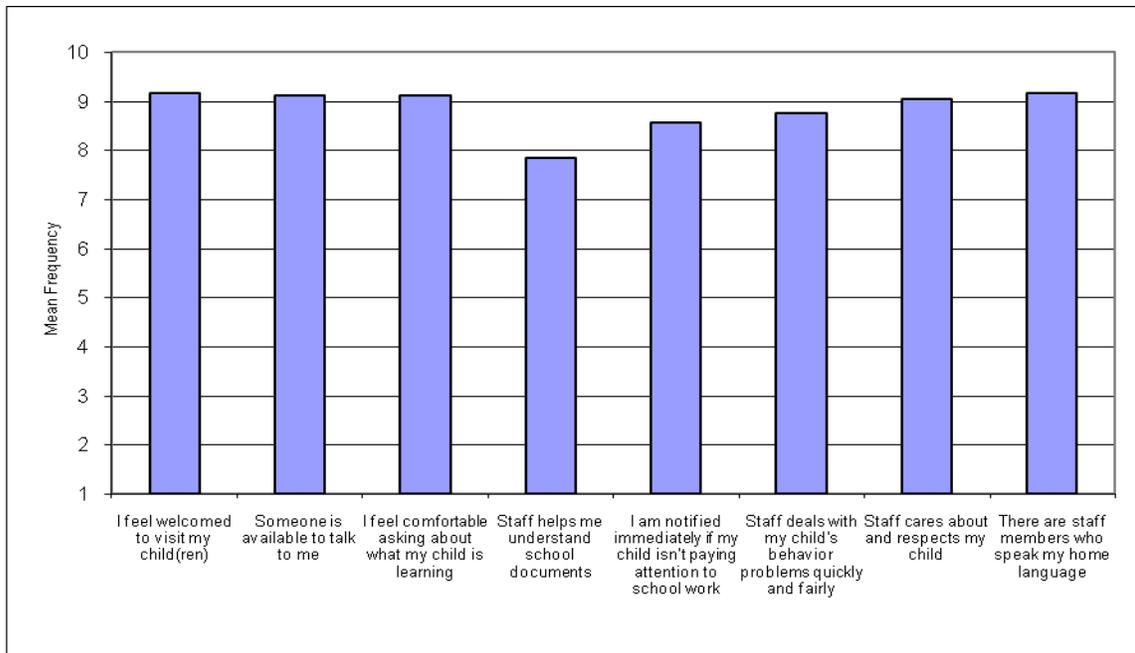

Figure 9. Parent perception of the program.

Interestingly, a pattern of progressively increasing parent satisfaction emerged over the 3 years. It should be noted that only quantitative data that were uniform across all six content areas were examined. Averages for each year were calculated and then compared across the 3 years. As illustrated in Figure 10, it appeared that parents felt progressively more satisfied with their children’s afterschool program over the 3 years. There was a small increase from Year 1 to Year 2, and a higher increase in Year 3 on all four ratings. In reading this table, one should bear in mind that the content areas under study were different in these 3 years, as were the parents surveyed. This heightened satisfaction could be a result of: content focus, time, or improvement in afterschool functioning, or any combination of such.

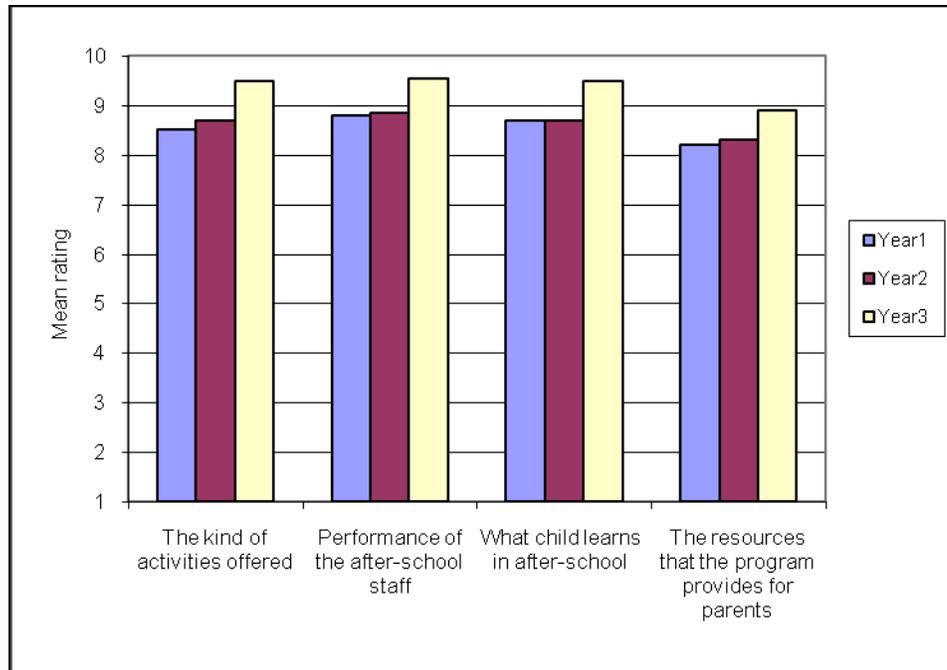

Figure 10. Parent's satisfaction w/ their child's afterschool program.

Connecting with the Community

Staff at many of the 53 programs mentioned ways in which their programs were connected with the community. Among the activities most frequently mentioned were through service learning, such as making get well cards for or reading to patients in the hospitals, taking trips to nursing homes to sing to the senior citizens, recycling or community beautification efforts, and cultivating community gardens. One afterschool program worked with a local charitable organization, not only to restore a public garden, but also to hike, take horticulture classes, go rowing, and swim in the lake. An instructor at another site described a local shopping campaign that entailed giving kids a budget and bringing local storeowners into the school to set up a mini version of the economy; and another instructor at the same site had a pet store owner come to the school and build a mock ecosystem within the building to teach kids about biology and conservation.

Another way in which the community was involved in the afterschool programs was through resources. Most staff members reported benefiting from various types of support and involvement from the local community. A broad range of community connections that served to enhance learning was reported. Benefits from these partnerships were especially valuable for arts, science, and technology programs where supplies were costly. For instance some art programs benefited from donated materials and supplies, funding, arts-related outings, and artists-in-residence programming.

Many programs also reported getting volunteers as a result of their affiliations with local universities and high schools. Other programs got volunteers from community organizations such as the Boy Scouts and Girl Scouts, churches, and Boys and Girls Clubs. For instance, in homework help programs many of the staff mentioned that volunteers from local universities and colleges were able to get involved in tutoring students. Furthermore, afterschool program staff also frequently invited science experts from the community to visit their program to offer students a more tangible experience of practical, real-world applications for science. As one project director explained,

What makes it unique at [our program] is we have so much community involvement in teaching science. . . . We've really tried to get experts in the field to come in. . . . I don't think that there is any program that has more community involvement in teaching students science than ours.

Another site coordinator from an art afterschool program echoed the importance of bringing community members into the program:

That's the beautiful thing about coordinating the afterschool program. My job is really to find these community-based organizations and individuals that that's their passion. That's what they like to do, whether it's art or drawing, cartooning, dancing, singing, whatever it is. You're actually bringing in people in the community that really enjoy what they do and want to teach that to kids.

By bringing community members and resources into afterschool programs, students were provided with opportunities to explore interests, identify role models, and become more immersed in their community. From the varied ways in which the afterschool programs enriched their students' learning experiences in the community, it appears they have a strong commitment to providing enrichment activities to strengthen students' self-concept, character, creativity, and community immersion.

Relationship Building with Students

In addition to building relationships with the community, afterschool program staff members understand the need to focus on building strong relationships with their students. Afterschool literature emphasizes the importance of the contribution of high staff expectations and positive attitudes toward students to the quality of the program environment and student achievement (Hall et al., 2003). Across the 53 programs, the quality of staff-student interactions was studied. Field notes and site summary reports indicated that positive relationships and interactions between the staff and the students were observed in all of the 53 programs.

Expectations for Students

Program staff members were asked about their expectations for students' performance. Although none of the programs responded that their expectations were low, they did differ in the ways they framed their expectations. Staff expressed that they felt the relationships they built with their students helped around expectations for student performance, disciplinary issues, and democracy. For example, about one-third of the programs responded that they expected their students to be performing at grade level or better; and nearly one-fourth of programs mentioned expecting students to do their best in academic performances. Science and arts programs distinctly expected their students to gain exposure and engage in science and arts experiences, while technology programs expected their students to use technology as a means for continuous learning in different life experiences.

Democracy in the Classroom

Although most programs were not designed to gather student feedback or give students many choices, especially the literacy, math, and homework help programs, staff from these programs enhanced students' sense of democracy by taking their interests into account when making decisions on program activities. For example, one program allowed students to offer input on where they would like to conduct their service learning projects; others considered students' activity choices. For example, at one site students were given the option between reading and doing homework.

Perhaps due to the context of the different content areas, arts, science, and technology programs placed a heavier emphasis on students' autonomy. As an example, arts program staff stated that student inputs were of great value; hence, student interests had a vast impact on art curriculum content. Staff felt these kinds of autonomy helped students in taking ownership in their learning process and helped to keep them engaged.

Motivational Support: Engaging the Students

In addition to positive relationships, motivational support is important in supporting students' academic achievement (Bempechat, Graham, & Jiminez, 1999; Ryan & Grolnick, 1986). The U.S. Department of Education (1994) states that increases in student academic engagement are associated with quality resources, as well as the pressure or incentives for students to invest in academic achievement. Miller (2003) states that students may be motivated by personal interest in a topic, the desire to please a teacher, peers, parents, and other adults; the knowledge that success has long-term rewards; and a desire to increase a sense of their own capabilities. Analyses revealed that a variety of motivational strategies were implemented at the 53 programs in the study sample.

Making Learning Diverse, Current, and Fun

Diversity in activities was one key way the various programs maintained interest among their students. The daily schedule generally comprised a combination of homework help and tutoring, academics, and some enrichment and/or recreational activity. Most programs had short periods of 30 minutes to an hour per activity, and a few used learning or activity centers that allowed children to move from one activity to the next at their own pace.

Programs tried to engage students by offering real world examples that connected the curriculum to their lives outside of school. This was particularly salient among science and technology programs. Across these programs, hands-on activities with real-world connections were the most popular instructional strategies. More than half of the technology programs reported engaging students in authentic, real-world, relevant activities; these activities frequently led to the development of marketable and applied skills. For example, some technology sites trained students to use software programs to produce music or graphic designs. Additionally, many science instructors reported inviting science experts to discuss real-world applications of science. The math programs also created activities that related to everyday life experiences like banking, shopping, and budgeting. As one site coordinator stated, “We use things like BMX bikes or other things that interest them.” Overall, most of the staff expressed a desire to further engage students by using relevant and real-world examples. They also accomplished this goal by referring to local places, familiar activities, and known individuals.

Additionally, programs attempted to make content more relevant by tying it to current events. A few sites indicated the use of newspapers and magazines in class, others mentioned studying popular culture like hip-hop and movies, some sites studied popular gadgets, and several sites used television as the starting point for an educational activity. Overall, popular culture references were readily utilized; national and world news events were rarely mentioned. A math instructor highlighted her use of current events:

When we have reading I like to use, especially on Thursdays when we do current events, the daily newspaper from town. I usually pick the story, but a lot of times I let them pick an interesting one. The last one we did was a big article about the presidential race. So we tied that into math.

The majority of program staff employed unique and innovative strategies to engage students in the afterschool setting, placing a particular emphasis on making learning fun. The primary reason given for this approach was the need to maintain interest after a long day at school. As one instructor aptly stated “Afterschool should simultaneously be fun and

informative.” To accomplish this, a number of strategies were used including cross content integration, dialogic and cooperative learning, culturally significant programming, special consideration for the students’ activity preferences, and the incorporation of enrichment and recreational activities. As mentioned previously, providing a diversity of activities, real world examples, and currency in learning were also strategies programs employed. Intentional or “disguised” learning was also popular; with sports, games, discussions and journal writing used to engage learners while pushing learning into the background. A site coordinator explained the approach:

I think that because a lot of our program is disguised learning, a lot of times the kids don’t even realize that they are doing math or that they are doing language arts or reading. So, in essence, we have them already developing a lot of social skills. During our “Why Be Healthy?” time, for example, when they are competing against other schools, they are learning team sports and character traits that are appropriate for youth.

Providing Opportunities for Social Development

Social development was emphasized in varying degrees at all programs, and positive socialization was generally observed among the students. When asked about program goals, about half of the staff members mentioned social development, and overall, student-to-student interactions at the 53 programs appeared to be positive, nurturing, and respectful. Many of the 53 programs mentioned providing additional program curriculum geared toward supporting students’ social development, increasing their self-esteem, and creating positive self-images. A site coordinator highlighted the way that all activities are related to social development: “I don’t think that there’s anything we do that in some way doesn’t impact either their image of themselves or how they interact with the world.”

Many strategies were used to enhance social development; the most commonly reported strategies included the use of group activities, multi-age groupings, rewarding pro-social behaviors, and encouraging peer collaboration. One of the strategies employed to promote social development was through activities such as art, field trips, sports, and character-building programs.

Almost all afterschool programs offered arts activities for their students, including poetry, dance, drama, choir, and drawing. One program instituted an innovative program, “Fun with Junk,” where kids created art projects out of recyclables. Other sites put on drama, dancing, or singing productions for fellow students, teachers, and parents, thus providing opportunities for students to work with and collaborate with one other.

Field trips were yet another method used to engage learners and provide real world links to the afterschool program subjects. More than half of the programs mentioned taking students on field trips. Parents were encouraged to volunteer for field trips; hence the benefits were threefold: enhancing education by providing concrete experiences, providing social development opportunities as students engaged in planning and discussions of the events, and furthering parent involvement. Math and literacy programs generally visited museums, zoos, libraries, and fire stations; while some took students to local festivities such as pep rallies. Art programs, generally, opted for museums and art exhibitions, for instance as one art program instructor explained:

Our program offers a field trip, for example to the Getty [museum], and most of my kids will go on that trip. And that's a really nice time in the sense that we're introducing the arts to them. We visualize, and then they have these field trips that correlate it together and reinforce what we're doing in class.

Some art programs arranged for a more interactive field trip experience, for instance, one site coordinator took students to the local orchestra so the students would pair up with a musician. Science and technology programs favored field trips that supplemented their curriculum such as science museums and technology centers. For instance, students at one science program were taken on a field trip to Lockheed Martin, a multi-national aerospace manufacturer and advanced technology company.

Character-building programs were also offered through many of the 53 programs. The site coordinator at a literacy afterschool program described two programs they offered for their students: "The girls get Smart Girls, which is also character building, but it deals with those life changes during puberty, taking care of your body in terms of hygiene, and what does it mean to be a . . . in society. Same thing for men, for the boys it's Passport to Manhood." Another site coordinator for a math afterschool program also mentioned a program called Character Development, which focused on teaching students values such as "honesty, respect, responsibility, and caring."

Summary of Program Process

In summary, the process for program implementation in the 53 programs showed a focus on program and staff relationships with parents, the community, and students. Most parent and staff communication was informal, often occurring during pick-up time. Written communication, such as newsletters, was sometimes used to share information. Despite some limited means of communication, parents felt the programs did a satisfactory job in keeping them up-to-date with program rules and practices. Parent involvement across the programs

was generally low; however, parents felt good that their children were well taken care of and disciplinary issues were dealt with efficiently and fairly.

With some exceptions, community involvement was not particularly strong at these programs. For math, literacy, and homework, community involvement generally consisted of service learning opportunities, volunteers recruited from the community, and students participating in community events such as paper recycling and beach cleaning. Arts, science, and technology programs appeared to have more in-depth collaborations with their community through sharing resources, both in materials and in expertise e.g., arts residence programs assigned artists to the afterschool program for a period of time to work with the students; Dell Corporation brought in materials, lesson plans, and technology assistance to the afterschool program; and local museums sent scientists to deliver a project with the students. Some of the programs also collaborated with local colleges and universities.

Afterschool staff and student relationships were characterized by warmth and mutual respect throughout the 53 programs. Almost all programs wanted the students to improve both academically and socially. In building relationships with students, staff in these programs had high expectations for their students and ensured the students were aware of these expectations. Staff also provided democracy in the classroom so that students had a voice and felt empowered and rules were made fairly and observed consistently. Some programs also provided character-building programs and all programs provided motivational support as well as desired to engage their students through activities. Consequently, minimal disciplinary issues were observed or reported.

Students' social development was also important in the process of program implementation at many sites. Staff employed techniques such as peer collaboration, different grouping arrangements, and cooperative learning opportunities to realize this goal. According to field notes, most student-to-student relationships observed at sites were positive. To facilitate learning, student motivation, and engagement, programs utilized five major techniques. First, they tried to make learning fun; the staff accomplished this goal by including recreational activities and disguised learning. Second, the staff broke up the day, and as a result students enjoyed a diverse set of activities. Third, the staff used real-world and relevant examples to teach the curriculum. Fourth, many instructors discussed current events, for example some instructors referred to popular culture and events. Finally, about half of programs made use of field trips, student performances, and exhibitions to advance learning.

CHAPTER 6:

GOAL SETTING AND CURRICULAR PRACTICES

This chapter presents the findings focused on goal setting and curricular practices. Four thematic areas will be discussed including setting program goals, standards-based curriculum, linkage to the day school, and research-based curriculum and instructional practices within specific content areas.

Goal-Oriented Programs

Through a meta-analysis of the literature RAND conducted, Bodilly and Beckett (2002) found that the setting of clear goals and desired outcomes is essential for program success. More specifically, the structure and design of afterschool programs should be guided by the purposes of the program. All 53 programs appeared to be able to structure their curricular design and program practices to facilitate meeting their program goals. For example, three of the math programs and four of the literacy programs specifically targeted students who were struggling academically. The site coordinator at a math program described their program goals as focused on developing students' academic skills within the math content area:

Our primary goals are to bring the student to grade level. That's my primary goal and covering the basics of addition, subtraction, multiplication and division.

Programs with achievement goals were frequently district affiliated and generally ran a more structured program, stressing the improvement of academic performance, hiring more certified teachers, and maintaining a more consistent linkage with the day school (in terms of curriculum coordination, communication, and adherence to state standards). The majority of the arts programs had a different focus. Their common goal was to provide students, who otherwise would have little to no exposure to the arts, with art experiences. Program staff, both instructors and administrators alike, frequently noted that while the afterschool curricula attended to the need for academic achievement and progress, arts instruction could also serve as a means to encourage creativity and discovery through expression—something most of their students had very little experience with due to recent school cut backs and financial short fall. As one site coordinator explained

These are kids that have never been exposed to anything—I mean really nothing. . . .
[Our goal is to] open the kids' minds to new things, and to show that they can do it. . .
.We wanted a well-balanced, well-rounded program with a lot of different things to offer to the children, to open their minds.

A number of interviewees further suggested that by using an integrative approach to arts instruction in afterschool programs they could potentially impact students who were struggling academically and personally.

Similar to arts, all science staff responded to questions about curricular goals by suggesting a primary interest in simply offering positive science experiences to students. As one executive director remarked, “[Our] primary goal . . . is to awaken in students a curiosity about science and the world around them.” Beyond this basic theme, a smaller percentage (slightly more than 20 percent) of interviewees across science programs characterized their curricula as mostly focused on academic improvement and achievement. Most of these respondents reported that they considered their programs to be an opportunity to extend science projects and labs from the day school to afterschool, as was the case of one site coordinator who remarked, “We’re growing on what they’re teaching [in the day school], trying to enrich those areas.” A few went even further to explain that their principle goal was to improve standardized test scores in science by focusing on extending day-school instruction into afterschool. One academic coordinator described designing afterschool science curricula with a strong academic focus in order to “bring students up to par for standardized testing.”

Technology programs appeared to have their main focus on developing students’ applied knowledge. Nearly all of the technology staff interviewed reflected the goal of teaching students the mechanics of a broad range of technology skills, in the interest of encouraging the students to use those skills to enhance learning in other content areas. Further, their goals included teaching the students a technical skill that can be relevant to their real lives, both now and in the future.

Only one technology program mentioned academic achievement as their primary focus. In this program, integrating technology into other content areas “to improve reading and math scores” was the primary goal, while staff across the other nine programs consistently explained that academics were just a piece of the puzzle, and development of skills in technology could serve their students on multiple levels. One project director explained that, by showing students that learning through technology can be interesting and relevant to their lives, the program could positively impact students’ futures far beyond elementary and high school experiences.

Everything that we do in afterschool, we try to make it somehow connected to the real world. . . . That’s one of our many goals is to make it relevant, that everything we do be relevant . . . to perhaps make a connection for them for a reason for staying in school, a

reason to go to college, a reason to be on a particular career path; and if technology is what fascinates them then that's what we will use.

Interview data across the seven homework programs suggested that the primary goals in afterschool homework help were to complete homework and increase academic achievement. Many staff members reported that assisting the students to understand their homework as well as increasing motivation to complete homework was important to achieve their goals.

We recognized that the other role we have to play is to get children engaged in the learning process. So it's not just about completing the homework, but it's about finding ways outside of the school to get them interested, excited, feeling confident, and to build their self-esteem so that even if they only do a third of the homework that they feel good about it, and they want to come back the next day and try a little harder. That's giving them some sense of motivation.

In aligning activities to achieve their program goals, nearly all interviewees described the merits of developing a curriculum that combined academic skill development with opportunities to explore, and encouraging students' social development. One program director summed up well in saying,

Our goal is to help each child to make sure that it's an afterschool program that's fun, but at the same time it's enriching, so they grow and learn every day, so they can take home some more knowledge.

Standards-based Curriculum

Through interviews with site coordinators and program staff, questions were asked related to their familiarity with their states' content standards, the ways in which curriculum are linked to the standards, and how coverage occurred. Additionally, program staff members were asked to explain which specific standards were covered in a lesson observed during the site visits. Overall, interviews revealed that most programs appeared to incorporate state standards into their curriculum. This occurred across programs to varying degrees with some knowledgeable about, and purposeful in, delivering a standards-based curriculum, while others appeared to make it a secondary, or less intentional, goal.

Most program staff reported they were familiar with the state standards, although levels of familiarity seemed to vary. Some program staff and site coordinators stated they had a strong knowledge of the standards, often because they were also day-school teachers, or because their program built on the day school's curricular structure. In about half of the programs, especially those that were community based, one or more of the interviewees

responded that they were not very familiar with the state standards. In most of these cases, interviewees further explained that they had some familiarity, or knew where they could find the standards. Also, a few respondents remarked that although they did not know the standards, they were aware that the afterschool curriculum they employed was tied to them.

Similarly, a few of the program staff were able to give detailed explanations of how standards-based contents were integrated into their afterschool curriculum. One program staff spoke of the ways in which she embedded standards into her instruction:

What we do is we break down the standards and make sure we fine-tune every standard. I just make sure that every word [of] what I'm teaching is a standard. I look in my book, and if the standard is not taught fully, I go to a different text or resource that will meet that standard.

Other program staff had more general views of standards-based curriculum. For example, a site coordinator at a math program had a more general idea of how standards were addressed by their afterschool curriculum:

We mainly come up with [curriculum] from general standards of what students should be working on, when they are in kindergarten or when they are in first grade. We take that information and a combination of what they are working on during the school day. So, we get information from the school day teachers whether it's weekly or if it's monthly, "My students are working on X, Y and Z this month in math." Then [afterschool] teachers create fun games and activities like that during that time. So, they might have a bingo game that's multiplication or some other thing.

Survey responses supported the qualitative findings. In Year 1, for literacy and math programs, the afterschool staff members were asked to rate their familiarity with state standards on a scale of 1 to 10 (see Table 10). In Years 2 and 3, the science, art, and technology program staff were asked to rate their familiarity with state standards on a scale of 1 to 5 (see Table 11). A higher score indicates greater familiarity with state standards. In general, it appears that math site coordinators were the most familiar, and technology staff were the least familiar. Since there are no homework content standards, homework programs were not included for this item.

Table 10

Mean Rating of Familiarity with State Standards (Scaled from 1 to 10)

Programs	Site coordinators	Program staff
Literacy programs	8.79	8.30
Math programs	9.5	8.24

Table 11

Mean Rating of Familiarity with State Standards (Scaled from 1 to 5)

Programs	Site coordinators	Program staff
Science programs	4.25	4.38
Art programs	N/A ¹	3.95
Technology programs	N/A ¹	3.13

¹ No survey responses on state standards were received from site coordinator in the art and technology programs.

For the technology programs, the survey results indicated a moderate level of familiarity with the technology standards. While most staff in these programs rated their own knowledge of technology standards at the weak to moderate level on the survey, the majority of staff interviewed described activities or methodology they employed that was clearly reflective of national and/or state standards for practice. For example, the majority of programs reported that students regularly engaged in activities aligned with the standards-based criteria such as: using technology tools for learning, productions, and creative exercises; using multiple technology resources to communicate information and ideas; using technology for research; and using technology for problem-solving in the real world.

Afterschool staff members were also asked whether they employed standards-based content instruction in their practices. Results revealed that many staff included standard-based content in their curriculum. However, within each content area, some standards were used more often than others. In the content area of literacy, 96 percent of staff reported using lower grade-level standards as represented by “vocabulary development” and “reading silently or aloud with fluency.” The upper grade level standards as represented by “applying self-correcting strategies to decode text” and “understanding literary techniques” were used by a lower percentage of staff (55 and 61 percent, respectively). Similar to literacy, math

staff also reported applying lower grade level standards such as “addition and subtraction of whole numbers” and “pattern recognition” more often; only 50 percent of the math staff reported on applying higher level standards such as “problem solving using equations” and “understanding/applying mean, range, and median.” In general, most science instructors indicated employing standards-based curriculum. Due to the vast numbers of contents available, there was wide variation in subject selections. For example, only 33 percent indicated that they worked with “reproduction and heredity” in their instruction, whereas 80 percent indicated they used the content “understanding of science/technology.”

Most of the arts staff reported employing standards-based arts curriculum. Ninety-three percent noted they applied the standard to “apply art techniques and processes.” The least common practice was in the integration of arts with technology, where only 33 percent of the arts staff indicated that they “use technology as a creative tool.” For technology, most of the program staff indicated they gave students opportunities to “practice responsible behavior and use of technology.” The least used standard, which only 43 percent of technology staff reported applying, was “research and evaluate the accuracy and bias of electronic information.” Once again, grade level played a role in the staff’s selections of content topics, with most of the choices leaning towards the lower grade levels. Since there were no homework content standards, homework instructors were not included. The details of the standard-based content areas and their use are found in Appendix C.

Linkage to School

Northwest Regional Educational Laboratory (2003) emphasizes that afterschool programs need a strong link to academics and other objectives in the day school to increase student achievement. This continuity of learning between the school and afterschool program is supported theoretically in the work of Noam, Biancarosa, and Dechausay (2002). These researchers posit that the “bridging” of school and afterschool helps to promote more meaningful academic learning. Miller (1995) further emphasizes that it is possible for students to “increase [their] sense of themselves as learners” and to “transfer positive experiences in a school-based afterschool program to more positive feelings about school itself” (p. 46). As seen in this and other literature, the linkage between the day school and afterschool program is an important factor in the quality of afterschool practices. For this study, the pattern of communications and relations between the day school and afterschool program were examined.

The staff survey inquired how frequently the afterschool staff communicated with the day-school teachers. Slightly less than half of the afterschool staff indicated that they

communicated with the day-school teachers frequently or regularly, whereas an equal number of afterschool staff indicated that they never or rarely communicate with day-school staff. About 20 percent of afterschool staff reported that they sometimes communicated with day-school teachers (see Figure 11).

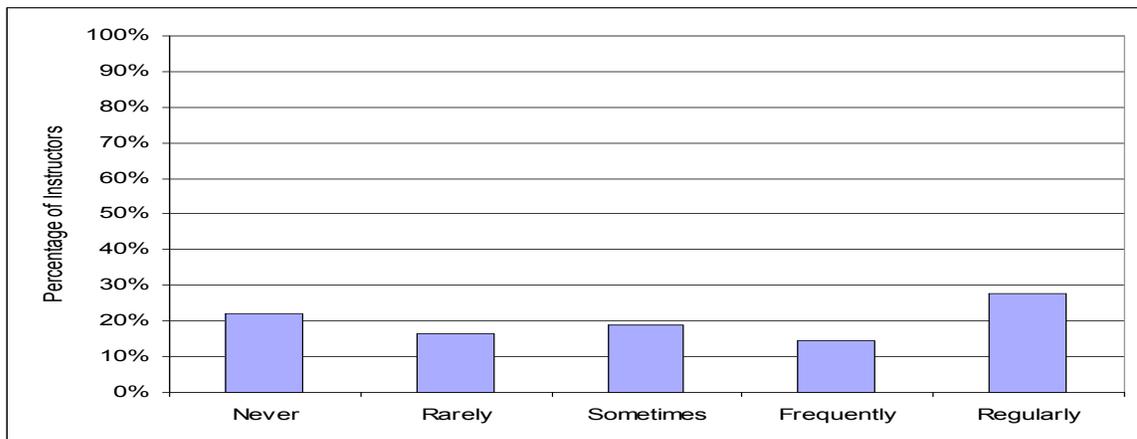

Figure 11. Frequency of communication between afterschool program and day-school staff.

Since a critical component of effective afterschool programming is the coordination of program content to the day-school curriculum, the interviews conducted with the afterschool staff probed deeper into the connections between day school and afterschool. A number of distinct themes emerged from the qualitative analyses. With a few exceptions, most afterschool staff reported a more casual form of communication with the day-school teachers, typically on an “as-needed” basis in regards to individual student progress and/or behavioral issues. Communications with the day-school teachers occurred mostly in forms of brief, informal contacts such as email or casual drop-in conversations.

A few programs described a more intentional approach. For example, overlap in day-school and afterschool staff was mentioned as a strategy to allow more collaboration and communication between day school and afterschool. In some district-affiliated programs, they referred to this process as a “seamless approach.” In other instances, a YMCA program made use of agendas, planners, and homework logs to communicate with day-school teachers relating to homework assignments, and coordination of curricular contents. Overall, the key topics on most of the communication between day school and afterschool were homework related, indicating homework was a crucial component of most academic activities in afterschool and a means of connection between the day-school and afterschool teachers.

An interesting exception was the science afterschool programs, where the majority of site coordinators (90 percent) and staff (93 percent), reported that specific staff members were assigned or responsible for communication with the day school. At a closer look, six of the nine science programs were district affiliated, with two of the other three community-based programs indicating strong ties with the day school. Staff at one afterschool program described a science program that was clearly the result of a collaborative effort between day-school and afterschool instructors, designed around and coordinated with the district's science curriculum, grounded in state and/or national science standards, and supplemented with purchased science kit materials. Science lessons revolved around a fish hatchery theme, developed primarily during day-school instruction, and maintained and studied throughout the year in both the day school and the afterschool program. According to interviewees, this concept provided a focus that gave students a beneficial sense of continuity between day school and afterschool science instruction. One site coordinator explained,

What's really neat about this is that it was a collaborative project. . . . We worked together. Not just one school building, but we got together and partnered with another building and we made sure that we had representatives from across the grade levels. So we've got pre-K through fifth grade and then specialists represented, and we designed the curriculum. . . . We went ahead and tied this curriculum to the national science standards, which will make it very easy for our school day teachers to incorporate this program into the school day, because it's electronic. All of their lesson plans are ready to go for this program, and it will all be tied to the national standards.

Some general commonalities were also found in terms of adjusting practice according to student need. For example, most district-affiliated programs reported including input from their day-school teachers when fine-tuning their curriculum. Other programs also solicited input from parents and students; two programs actually employed an education coordinator in their programs to manage coordination with the day school in curriculum development.

Research-based Curriculum and Instructional Practice

Afterschool program instructors were also asked about the use of research-based practices and teaching strategies, including curriculum development and practices in the six content areas. Most afterschool programs indicated that they designed the curriculum, rather than rely on pre-designed or purchased curriculum. At one arts program, decisions about the arts curriculum were clearly a collaborative effort in terms of both afterschool teamwork and working closely with community partners and the day school. This program's approach appeared to be integrative in many respects, but most evidently with regard to arts curriculum

development. The arts community partnership director at the afterschool program explained the process in detail:

[Our arts program is] self-designed. We don't purchase any programs. . . . We work with a variety of artists. . . . We are really responsive to the community. . . . We create curriculum that addresses that. . . .The artists ultimately are the ones that carry that out. . . . We talk together with them. . . . we meet with the principals and different representatives before we do any scheduling for the session, to talk about the curriculum areas. . . . The artists do the lesson plan of the actual lesson. . . . Then we look at each session and what an overarching curriculum area might be Then we work with our artists to come up with a variety of ways to address those topic areas.

This approach to curriculum design was also echoed by a site coordinator at a science afterschool program: “[The curriculum is] self-designed—nothing is cookie cutter here. . . . Our teachers design everything that we do here”; while another site coordinator stated simply that the program staff “come up with their own curriculum and they make sure it ties with the [state] standards.”

On the other hand, some programs did indicate using curriculum from the day school or that were pre-designed. The project director at another science afterschool program indicated that they relied primarily on the day-school curriculum:

First of all, we use what is being taught in the school day. We take whatever curriculum they're using and enhance that. The way that we do that is we actually use our regular day teachers as our afterschool teachers. The curriculum is already there. We use what is on their lesson plans. We take from that and work with that as far as what we do in the academics. We also advance into that by having projects and programs with research based things, such as *Design It*, which is a science project. We use their curriculum for our science activities, *Wide Span* for reading and math.

Similarly, a site coordinator at a literacy program remarked that the curriculum used was pre-designed and straightforward: “It's very recipe-like. It tells them exactly what questions to ask prior to the book, the activity suggestions. It's very laid out for them, so it's very user-friendly.” Overall, while some programs chose to use pre-designed curriculum and others preferred to design their own, all programs had consensus that they want to employ curriculum that would support students' academic competence, while making learning fun and less rigid than in the school day.

To implement the various curricula, some of the common practices across the six contents included scaffolding techniques that appeared to be correlated with grouping strategies, and the “real world” approach that was used to encourage student learning by

infusing the learning process with cultural and social experiences that were relevant to their lives. Other common practices in science, arts, and technology were described as a “hands-on” approach; active participation; “learning through doing”; students making connections on their own; and the constant shifting from guided work, to group work, to pairs work, then to self-paced work, and back once more to guided work at a higher level.

In general, survey data suggested that afterschool staff employed a wide range of research-based practices to support and facilitate their students’ learning. The analysis of the survey data revealed that there were variations based on the content focus. For example, technology programs reported the most frequent use of research-based practices whereas literacy programs reported the lowest frequency. Furthermore, technology, science, arts, and homework programs appeared to be more focused on developing higher order thinking skills, whereas literacy and math programs were more focused on direct teaching. For instance, one technology instructor talked about teaching her students to problem-solve: “You have to know how to fix it. How do you solve this problem? The engineer is sitting in that seat now, and something goes wrong, you’ve got to troubleshoot. That’s part of life with anything. Troubleshooting and problem solving skills are needed.” Specifically, in science content, the most frequent practices were (a) describing scientific procedures to students, (b) using tools to gather and analyze data, (c) designing a scientific investigation, (d) conduct simple experiments, and (e) using evidence to predict and explain. All these strategies were designed to promote applicable techniques and higher order thinking skills and were practiced fairly evenly across all science programs.

On the other hand, math and literacy programs were more focused on direct instruction. For example, math staff reported the use of mathematical tools, asking students to solve world problems, and providing instructions to solve math problems most frequently. The less frequently practiced instructional strategy appeared to be in the arena of developing students’ higher order thinking skills such as providing unstructured opportunities for students to investigate and explore, and having students write justifications for their work. The least practiced strategy in math and literacy programs was having students actively participate in hypothesis testing. In many of the math and literacy programs, program staff mentioned teaching knowledge facts through direct instruction. One math staff commented, “So we have pretty much tried to stay with just basic facts for them to learn math facts.” Another literacy staff talked about literacy instruction: “In particular I work with two students that their parents requested them to stay here with the afterschool program because they don’t have the support at home to read and learn vocabulary with their parents. So I try to make a point to read and study words with them.” These trends may have been the result of differences in

content characteristics, and/or a process of program maturation (since math and literacy were visited in Year 1, the afterschool program as a field has gone through rapid development and maturation). The frequencies of the usage of specific instructional practices under each content area can be found in Appendix D.

Another strategy was the implementation of cross content integration. Over the six content areas, the curriculum for technology was the most integrative; these programs incorporated technology learning into many of the afterschool activities across academic content areas including science, literacy, math, and arts. One site coordinator commented on the integration of technology into the afterschool curriculum: “In most all of our subject areas technology is incorporated somehow and integrated into it.” She further expanded:

I talked about the language arts. The math you could get into how many beats per minute for a song. You have to do counting. When someone is doing the background music you have to figure out how many counts, how many beats per minute or per stand that they’re doing it on. So there’s a lot of math involved with that. Science, I’m sure there’s a science, but I can’t pick it off the top of my head. Art, we actually have one of the teachers from Henninger’s. She incorporates a lot of art, and especially when they do famous groups. They might work on a comic book or a stage set, so they do a lot of drawing and things like that or even computer parts.

Homework programs also had a broader conception of instruction that focused not only on homework assistance and completion, but also on developing study skills, work habits, and organization skills. The four skills most staff mentioned enforcing were: development of time management skills, development of skills in using reference material, development of note taking skills, and strategies for test preparation. For instance, one homework staff member commented on modeling note-taking for her students: “I’ll give notes to try to explain to the kids this is how you should take notes when I’m doing it. You don’t have to write everything down, but then there are some teachers that want you to make sure you write everything down.” Another staff member mentioned teaching study skills as an important component of afterschool homework instruction: “Teachers sort of become experts at homework at some point. I do work with my students on study skills. It’s really what I focus on. It doesn’t matter if it’s homework or if it’s class work or if it’s just some extracurricular activity that they’re working on, but I really work on study skills with them.”

Summary of Goal Setting and Curricular Practices

In general, the afterschool programs adhered to the structure of goal-oriented programs as reviewed in the literature. Almost all programs under study had set clear program goals and objectives, and designed strategic plans to achieve their goals. For example, some of the

math, literacy, and homework programs had improvement on academic achievement as their program goal. These programs hired credential teachers as instructors, focused their curriculum and teaching strategies to enhance student academic achievement and academic skill building.

Math and literacy programs tended to focus more on improving basic skills whereas science, arts, and technology programs had goals of exposing and engaging students to their specific contents. The science, arts, and technology programs hired and/or collaborated with experts in their field and emphasized exposing students to a variety of experiences, providing students with enrichments and personal experiences. The staff in these programs tended to focus on developing the higher-order thinking skills such as gathering data, analyzing data, and reporting/presenting the findings. Homework help programs' intent was to provide more skill building to their students through improving students' organization, time management, and test preparation skills in addition to supervising and monitoring homework.

At the same time, all 53 programs had broad knowledge of national and state standards in their content areas, and alignment with standards was obvious at most sites. However, although most programs were employing standard-based curriculum, some of the program staff were not well versed in expressing links between standards and their curriculum. As a point of interest, while almost all programs adhered to standard-based curriculum, most of the programs, regardless of grade levels, tended to focus more on the basic standards rather than the more advanced standards in their content area. This may be a reflection of the demographics of the student population since all the programs were working with low-performing schools, and perhaps populated with more primary grade students.

Some of the common research-based practices across the programs included 1) a real-world approach that was used to encourage students' learning by infusing the learning process with cultural and social experiences that were relevant to their lives; 2) a hands-on approach, particularly in science, arts, and technology; 3) giving students the freedom to test and expand their own knowledge through doing; 4) emphasizing students "learn through doing" and make connections on their own; and 5) constantly shifting from guided work to group work to pairs work, then to self-paced work and back once more to guided work at a higher level.

Although all programs appeared to maintain positive relations with the day school, most of the linkages were in casual formats and communication with day-school teachers often happened on an as needed basis. On these occasions, homework was usually the key topic. Some programs, especially the district run programs that usually constituted shared

staff, had better communication systems in place. A few district-run programs emphasized a seamless approach where an afterschool program could be considered as an extension of the day school. A few community-based programs also made specific efforts to maintain open channels between the school and afterschool. In one program, a key person was designated as liaison between the day school and afterschool. In another program, a system of homework logs, checklists, and meeting dates was set to ensure frequent correspondence.

CHAPTER 7:

EVALUATIVE STRUCTURES AND PROGRAM IMPACT

Program Evaluation

Nationally and across a number of states, there is a growing emphasis on the evaluation of afterschool programs. Those funding afterschool programs want to know that their investment is making a difference and are encouraging programs to engage in continuous improvement, making assessment and evaluation an integral part of every program.

There are typically two types of evaluation that apply to afterschool programming: internal and external. Internal evaluation is a process of quality review undertaken within an institution for its own ends. External evaluation is the appraisal process performed by an agency or individuals not directly involved in or responsible for the program or activities evaluated. Interview and survey responses across the 53 participating programs in this study indicated that even though rigorous examinations of data were rare, all of the afterschool programs appeared to be conducting varying degrees of internal and external evaluations of their programs. Overall, project directors seemed to be the most knowledgeable about evaluation, particularly external evaluations. Site coordinators were usually familiar with their individual sites' internal evaluations and quality assurance procedures. Program staff members were most familiar with informal student assessment procedures and tools utilized to monitor student progress at the classroom level.

External Evaluation

Responses from interviewees suggested that many of the programs were evaluated externally, sometimes by an evaluation organization experienced in program evaluation. Most interviewees consistently indicated that their evaluations were of the entire program. The methodologies utilized in these evaluations typically included pre-post testing or classroom evaluations, comparison groups, surveys, focus groups, observational assessments, or a combination of these methods. In general, interviewees from the majority of the programs reported positive results from these evaluations, although specific results were not supplemented and/or substantiated with reports.

Only the technology programs reported having content specific evaluations. These evaluations were undertaken by a variety of public and private organizations including Dell, Intel, and universities. The evaluations tracked the overall effectiveness of the technology and larger curriculum, often using computer software to monitor student progress in the day school as a barometer to adjust afterschool programming.

More than half of the literacy and math programs closely affiliated with the school districts did not conduct an external evaluation and approximately one-third of all of the programs mentioned having an external evaluator. A significant number of the programs considered the process of preparation for the Annual Performance Report (APR/ PPICS) and the visits from the state coordinators as a form of external evaluation.

Internal Evaluation

All but two programs reported conducted formal or informal internal evaluation. Evaluation varied from informal conversations between afterschool staff, day-school staff, and parents to a formal administration of surveys to students, parents, staff, and tracking of test scores, grades, and attendance records. One program reported a relatively rigorous formal evaluation process that involved quarterly assessment reports from staff, pre-post testing, tracking of grades and student progress in the day school, and student surveys on program satisfaction. The program director explained the intent of the evaluation:

Once a quarter, each [site] has to come together and present to the Board as well as [the director] about what happened last quarter. It's not just what happened from a laundry list. We're trying to create a learning organization. It's an opportunity for the unit directors to share among themselves and to learn from each other. It creates opportunities to share ideas. And it bring a little bit of accountability in.

Informal evaluations often occurred in staff meetings, i.e., a discussion about what was and wasn't working. One instructor explained, "There is an informal evaluation where we're always talking about what's working and what doesn't work and about what we could do differently." At another setting, a project director said that questions such as "Do you feel [the program is] effective? Do you think your child has learned?" were addressed to parents and teachers to help the program assess itself. Other means of informal evaluation was talking to students, parents and day-school teacher feedback, collaborating with peers, and anecdotal evidence from individual students who had transformed during or after participation in the program.

In general, interviewees most frequently mentioned using the results of internal evaluation to serve as a baseline for instruction, monitor student progress, and to document program impact. For example, the principal at one of the science afterschool programs reported that student achievement data from an internal evaluation were used to revise science curricula at the afterschool program in order to align instruction with the standards and improve student performance:

That was the reason why the [afterschool program] curriculum went under revision, because [our students] were not measuring up nationally. When you look at their assessments on the [state test] . . . they weren't measuring up with other states; and because of that we had to go back and revisit our curriculum to see where we were falling through the cracks. What we found was that we [needed to revise] our objectives—they were too narrow. So teachers were limiting instruction to just those methods, when really there was a whole standard that needed to be scored. There was a whole area that children needed to know by the end of the school year, so that revision had to take place.

The community-based programs all reported conducting internal evaluations on a regular basis, some more intensive and extensive than others. They appeared to have a broader focus, and utilized a mixture of parent, staff, students', and classroom teachers' surveys to seek feedback. These data served to inform programs from multiple perspectives, provided a continuous feedback loop for self-improvement, and measured program satisfaction rates.

A pattern emerged in the resources and purposes of evaluations between the community-based programs and the district-affiliated programs. It appeared that the district-affiliated programs seemed to have easier access to student academic databases and about half of these programs made use of this access to establish baselines and determine areas of academic need for their students. The student academic database and classroom grades were also used as outcome measures in determining academic growth and progress, especially for programs with the explicit goal of raising students' achievement scores.

Perceptions of Program Impact

All programs reported having positive impacts on their students in some ways. Most of the evidence provided was anecdotal, but a few formal evaluations and systematic tracking of student progress showed improvements in attendance, classroom grades, and achievement scores. At the less quantifiable level, several programs reported improvements in attitudes toward schooling, student efficacy, confidence, and engagement. Moreover, individual success stories highlighted the transformational potential of the afterschool setting in improving study skills, attitudes, and behavior, as well as increasing the self-esteem of students and their social competencies.

Most staff interviewed reported that their program had impacted students positively in some way. While most feedback on this topic was anecdotal, interviewees most consistently cited improvements in the areas of attendance (both in the day school and the afterschool program), engagement and interest in the content area, social behavior, and student achievement.

In interviews, staff indicated that their students' attendance, both to the afterschool program and to the day school, was consistent and showed growth over time. However, few of the interviewees provided evidence that linked attendance to achievement. Most of the programs also noted that there was a waiting list for their programs, and indicated that there were no recruitment or retention concerns. While most respondents mentioned that students loved to come to the afterschool program and even preferred attending the afterschool program to the day-school program, very few provided enough detail to draw substantial conclusions. Nonetheless, afterschool program staff perceptions on program impact are worth noting here, and a good number of staff members commented that student interest in their afterschool program had facilitated improvements in attendance. One arts instructor noted,

Attendance is unbelievable. I have kids that say, 'I only came to school today because I knew I was going to be working with you.' I feel, just from talking with my teachers, that behavior problems in some instances are resolved. Students have success in my class.

Further, the following impressions offered by a project director for one of the science afterschool programs indicated a breadth of afterschool program impact not always captured by quantitative data:

I want [the program] to be measured by supporting school success, because that is what I think leads to academic achievement. We have clear research that says that the children in our afterschool program have better attendance. Their truancy has decreased significantly. They're not tardy. Their behavior in class increases significantly. Their connection to a professional adult as measured by the child increases significantly—statistically significantly. . . . Those are the things to me that eventually translate into school success. So we do think we're improving academic achievement. . . . We think that is significant.

A technology program director reinforced this assertion and explained:

There's a whole part of afterschool that is so hard to put into an evaluation form. That's how you change lives and what you offer, the possibilities and dreams that can come true. That's so hard to put into a question. I think it's very important that everybody understand the power that can come from an afterschool program in affecting change, not only cultural change on campus but also individually in particular lives. I have seen a whole campus turn around demonstrating that learning can be fun and can still address the needs for standardized tests. Their sense of accomplishment that comes from being in one of our programs where they have more freedom to explore and have more hands-on experiences is profound.

Some program staff also mentioned improvements in students' achievement and attitudes towards learning. Most of the feedback was clearly anecdotal and related directly to

staff perceptions. Yet, some programs were able to cite specific academic gains. For example, some of the district-affiliated math and literacy programs observed growth in district test scores and/or classroom grades, and many homework staff stated that the students' achievement was greatly related to the homework assistance given at afterschool programs. This was corroborated by a day-school principal,

Our test scores have risen every year for four years. They had gone down every year for seven years before [the homework afterschool program started at the school]. In the last four years, and including this year again, they're up anywhere from three to five percent. A lot of it is because we started working together.

All program staff across the content areas also mentioned a marked improvement in students' engagement and interest in the content area over time. Almost all interviewees reported that students were happy and enthusiastic to be at the afterschool programs. They were eager to attend the programs, and some staff reported that even when the students were absent during the school day, they still wanted to come and attend the program. Additionally, staff also frequently remarked that students expressed a new appreciation for, and interest in the focused content area. For example, one science staff member explained, "I've had my seventh and eighth graders tell me that they want to go into a career in science instead of being a dancer or a football player or something like that. They've actually told me they want to get a career in science." Similarly, a staff member of a technology program explained the value and relevance of her technology instruction,

We see a big improvement at the high school. What we're finding is if you give the student the laptop, which we provide for every student to take home and use, they complete their homework and it's higher quality. . . . Even our students that have social problems, when they're more fixed on a project that [uses] the computer, they do a lot better. We see a lot of better behavior in those children.

Consistently, all program staff reported having positive relationships with their students, and suggested that the afterschool programs have had positive impacts on students' self-confidence, social skills, and attitudes towards learning. Observation data supported the interview data, with students observed to be actively engaged in activities at most of the sites. Programs appeared to make specific efforts to select materials that were of high interest to students, and program staff engaged students with meaningful questions and frequent attempts to get students involved. A majority of the interviewees indicated that their students enjoyed and benefited from the afterschool program, and some felt that the afterschool programs appealed especially to students who were academically disengaged by offering them the kind of personal attention and assistance they needed.

Parent Satisfaction

Parents were surveyed and their input on program satisfaction and perceived academic impacts were analyzed. In general, parents reported seeing improvements in their children’s skills and overall interest in the specific content area, in their work during the school day, and in finishing the specific content area homework on time (see Figure 12). About three-fourths of the parents perceived that their children’s skills and interest improved since participating in the afterschool program, while a minimal number of parents (1 percent) saw a decrease. Approximately 11 percent to 13 percent of the parents did not perceive any changes in their children’s performance or attitudes, while an average of 7 percent were not sure about any changes. The survey also asked parents about changes in their children’s interest in schoolwork in general, and results found that 44 percent of the parents saw a great improvement.

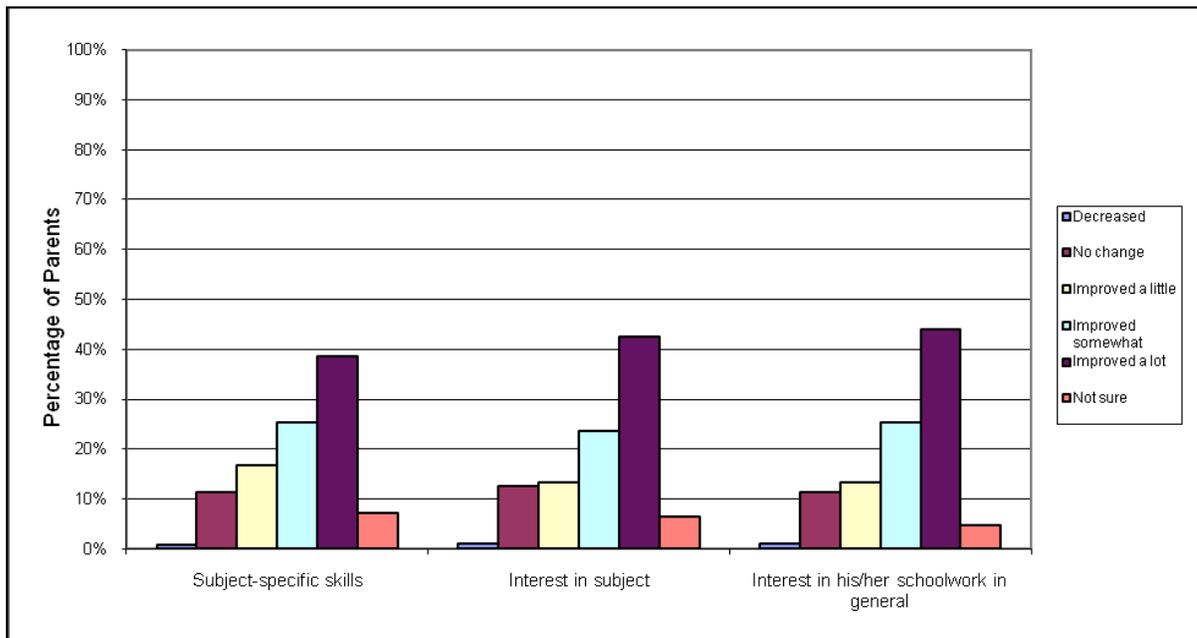

Figure 12. Parent perception of changes in student behavior.

Day-School Impact

Day-school teachers (only in Years 2 and 3 for the arts, science, technology, and homework help programs) were asked to describe perceived changes in their students since those students began participation in the afterschool program, including any behavioral changes. They were also asked to provide their assessments of the changes in students’ performance and attitudes. Most teachers, for the 35 programs in Year 2 and 3, reported that they noticed positive changes in students’ behaviors in terms of school attendance, frequency

of classroom participations, effort on school work, paying attention in class, and discipline problems, as displayed in Figure 13 (further detail can be found in Appendix E).

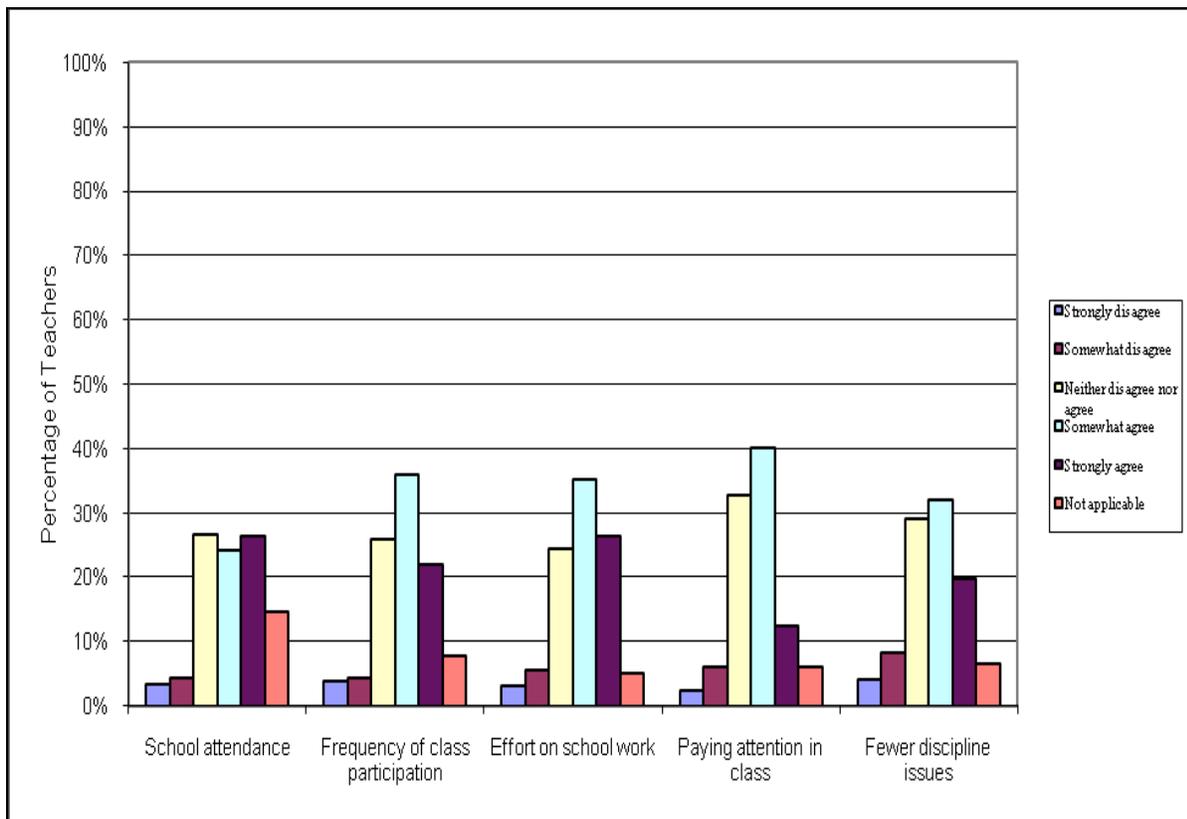

Figure 13. Teacher perception of changes in student behavior.

About 10 percent of the day-school teachers had not noticed a positive change in students’ behavior in terms of school attendance, frequency of classroom participation, effort on school work, paying attention in class, and discipline problems. About half agreed that their students in the afterschool programs had improved in school attendance, were paying more attention in class, and had fewer discipline problems. In addition, 58 percent of the teachers agreed that the afterschool program students increased their frequency of class participation, and most teachers (61 percent) agreed that their students in the afterschool program put more effort into school work.

Day-school teachers were also surveyed in regards to their perception of any academic performance and attitude changes in students participating in the arts, science, technology, and homework help afterschool programs. Academic performance and attitude changes were defined differently according to the specific content area. The definitions for the four content areas were as follows:

- Arts: willingness to participate in various arts activities, the overall quality of their art projects, perceptual and expressive skills, technical skills (e.g., ability to paint, sing, play a musical instrument), attitudes toward the arts in general, and ability to engage in higher order thinking.
- Science: science skills, science test grades, attitudes toward science and homework, and the quality and timely completion of science homework.
- Technology: participation in technology activities, overall technical skills, attitude towards technology, engage in higher order thinking, cooperative collaborative skills, persistence in school work, and problem-solving skills.
- Homework: motivation for completing homework, ability to complete homework, time management skills, organizational skills, cooperative and collaborative skills, performance on tests, persistence in school work, problem-solving skills, study and research skills, and quality of work overall.

Most notably in the four content areas, a majority of teachers perceived an improvement in their students' overall interest and skills in the content-specific area. Most teachers also noticed a positive increase in their attitudes towards the content area. Perhaps due to the fact that some of the teachers surveyed did not directly supervise the students in arts, science, or technology, up to 30 percent of the teachers responded that they did not know whether there had been a change in the students' academic performance. Meanwhile, of the teachers whose students participated in homework assistance afterschool programs, 47 percent to 75 percent perceived improvements in their students' performance on tests and their ability to complete homework.

Summary of Evaluative Structures and Program Impact

In summary, external evaluations on the content-specific component of the programs were not always conducted. Only technology programs consistently reported having external evaluations on the technology component of their programs. In other programs, if external programs were conducted, they were usually program wide where the findings were generally positive and strong evidence to support the claims was rare. Most of the programs conducted internal evaluations, some more formal than others. The purpose of these evaluations was for program improvement, such as monitoring student progress, measuring program growth, research for program needs, and gauging program impacts. Except for some of the district-affiliated math and literacy programs, student assessments throughout the programs were informal, generally in the forms of spot checking, questioning, and observing student understandings.

Overall, parents, staff, and teachers perceived programs to have positive impacts on student engagement, attitudes, skills, and their knowledge. More specifically, programs were

perceived to improve attendance, especially if the students were engaged in the afterschool programs. Students appeared happy and enthusiastic to be attending the program, and engaged in program activities. All afterschool staff reported having positive relationships with their students, and consistently suggested that the programs had positive impacts on students' self-confidence, social skills, and attitudes towards learning. Most of the program staff mentioned an improvement in students' achievement and attitudes towards learning. Day-school teachers reported that they perceived improvements in the students' attitudes and skills toward four of the six content areas. Behaviors (i.e., school attendance, frequency of class participation, effort on school work, paying attention in class, and fewer discipline issues) were also perceived to have greatly improved. In all of the content areas (except homework), parents also perceived improvements in content-specific skills, interest in a specific content area, interest in schoolwork in general, and finishing content-specific homework on time. Parents with children in the homework help programs saw improvement in their child's motivation to complete homework, ability to complete homework, time management skills, organizational skills, and interest in school work in general.

CHAPTER 8: IMPLICATIONS AND CONCLUSION

The findings in this study indicate that the characteristics of the identified afterschool programs appeared to be aligned with the criteria established for high quality practices in terms of program structure, student engagement, instructional strategies, and issues of accountability which served as the basis for the development of the logic model.

The common characteristics that were found across the afterschool programs are listed here:

- These programs had strong leadership and established clear goals
- They aligned program structures and contents to meet goals
- They set a schedule that allowed time for students to learn and practice
- They established relationships with the day school
- Their curriculum in general reflected a linkage to standards
- Most of the programs used research-based strategies
- They all maintained some form of evaluative structures
- Staff members had low turn over rates
- Staff members related well to the students
- The staff were able to build rapport, maintained high expectations, kept students motivated and engaged.

Examples of these common characteristics follow. To increase the students' academic skills, many of the math, literacy, and homework programs used a "seamless approach" to connect day school with afterschool and employed certified teachers. To expose students to the experiences of science, arts, and technology, programs used hands-on approaches and generally collaborated with organizations strong in the specific content areas, such as Arts Corps, Girls' Inc., local universities, Dell, Apple, etc. Almost all of the 53 programs maintained good relationships with the day-school personnel. However, few of them had established formal communication systems for that purpose. Across all the programs, staff had knowledge of content standards and engaged in content specific research-based instructional strategies. To engage students and staff, these programs recruited qualified staff and created working environments that built relationships and inspired support for the programs' missions. Because staff felt respected, supported, autonomous, and confident in their ability to reach their students, these programs were able to retain staff and achieve lower turnover rates than other programs. In turn, staff and students were able to construct positive

relationships with each other, characterized by warmth and mutual respect. This supportive relationship permitted the staff to serve as role models, creating a norm of high expectations and strengthening student behavior, school attendance, work habits, and attitudes towards learning. At the same time, most programs also recognized the importance of considering student voices when making decisions regarding program activities and content; hence, many programs allowed students to provide input, especially in the arts and technology programs. Many of these programs also made use of research-based strategies to engage and motivate students, making learning fun. Overall, programs reported some form of internal and/or external evaluations for accountability and self-improvement purposes. As a result, students seemed engaged and excited to be in the programs. In general, day-school teachers, parents, and afterschool staff perceived the programs to have positive influences on the students. Some programs reported increased school attendance, better test scores, and most of the programs reported positive changes in behaviors and attitudes towards learning. Parents were very satisfied with the programs both in terms of positive changes in their children's behaviors and attitudes, and in general program functioning.

As discussed earlier, the single most dominant characteristic that was consistently revealed in all programs was the high motivation level of the sites. These high functioning programs were characterized by strong leadership. Staff members were empowered to engage in program missions that included internal motivations, such as making a difference in the lives of their students. It appeared that this intrinsic motivation for staff members to bond with the students was a powerful force toward the aspirations of both the staff and the students. This relationship can be further enhanced, so that the afterschool staff can foster the relationship to induce academic resiliency in their students. As a result of the findings, there are numerous implications for high quality afterschool practice.

Implications for High Quality Afterschool Practice

As the quality of afterschool programs is further embedded in the social systems of schools, families, communities, networks, state, and federal policies and regulations, all will have to function collaboratively together to induce sustainable change in students. Since key findings of this study point to the strength of strong leadership, alignment to the day school, and the motivational value of the staff-student relationships, there is the potential for enhancing staff skills to create a tighter social system and bring in more resources from the day school, families, and communities. In order to do that, there is the need to provide meaningful, informative, and regular professional development opportunities to the afterschool staff to further enhance their abilities and collaborative skills. However, as the findings of this study indicate, the participation rate in professional development is quite low.

Therefore, additional incentives through policies and guidelines are needed to encourage staff to take part in the professional development. These can be achieved through: (a) policies that support staff (professional) development, (b) funding sources and designations, and (c) ongoing program evaluation to prescribe professional development needs.

Professional Development

The study's findings show that professional development was not regularly offered at all programs, and when offered, participation rates tended to be low. Moreover, project directors and site coordinators appeared to attend conferences and workshops more often than the program staff. This may be due to a number of factors, including the higher turnover rate of other staff members (in comparison to project directors and site coordinators), the tight scheduling in afterschool programs (which makes it difficult to spare staff members for professional development), and limited budgets to pay staff time for professional development or to pay for substitutes. Since professional development has a strong correlation with staff efficacy, quality of the delivery of the intended lessons, and hence student outcomes (Ingvarson, Meiers, & Beavis, 2005), federal and state policies guiding the development and operations of afterschool programs should take the study findings into consideration and provide additional guidelines and regulations for the provision of sufficient quality professional development opportunities for afterschool programs.

At the site level, program directors and site coordinators should provide professional development opportunities to increase staff readiness to address student needs. Program directors should re-examine program goals to decide whether site coordinators or program staff would benefit most from attending certain conferences and professional development opportunities, and make decisions accordingly. If there is a "training-of-the-trainer" approach at the sites, a systematic approach or manual should be established to ensure professional development fidelity. When planning the yearly calendar, time off for professional development, reserving substitutes for the staff to attend professional development, or closing the program a few times a year to allow for staff development should be considered.

The findings also point to several specific areas where afterschool staff would benefit from professional development: (a) content and curriculum, (b) collaboration with the day school, (c) evaluation and assessment, and (d) parent involvement. While most program staff were aware of the standards within specific content areas, they were less knowledgeable about the links between the standards and their instructional practices. To support program staff in becoming more familiar with curriculum standards and to be more creative with the

implementation of these standards in their instruction, professional development in content and curriculum should be consistently provided.

While discussing relationship building and curriculum content and standards, it should be noted that the positive relationships that existed among the students and staff may have been due to a variety of unexplored variables that researchers are not yet able to affirmatively identify (e.g., that the afterschool staff were from the same community; the afterschool staff shared similar life experiences as the students and were able to connect to them better; a certain aspect of their personality made them more appealing and trustworthy to the students, etc.). Thus, one should not be hasty and take the short route in replacing current staff with certified staff in order to promote better academic outcomes, instead professional development and enhancing the readiness and knowledge base of the current staff would be the recommended route.

To facilitate this practice, state agencies should set policies to guide program functioning and provide periodic monitoring to ensure that staff members receive adequate professional development to meet program expectations for high quality, engaging academic instruction. State agencies should also work closely with professional development providers and afterschool programs to coordinate the professional development topics offered at national and regional conferences to meet staff needs and interests. With the efficiency of technology, toolkits such as the ones offered by the National Partnership, make it possible to instantly deliver to any program the most up-dated instructional practices in a cost-effective way, and these should be utilized at all program levels.

Furthermore, when making policies regarding afterschool programs, policy makers should keep in mind that even with the best pre-approved, flawless research-based curriculums, the delivery of the content is as important as the content itself. Thus, policies and legislation guiding program certifications and recertifications should consider the need for staff members and administrators of afterschool programs to maintain continuous professional development, updates and support with the new developments in the field.

The role of the day school in professional development is also critical. The study findings indicated that the day school plays an influential role in the efficiency of their affiliated afterschool programs. The day school can provide space (e.g., classrooms, playgrounds), and resources (e.g., use of computers, academic and behavioral data on the students, access into classroom records, professional development opportunities, etc.) that are important to afterschool program organization and student learning. All of the programs visited in this study maintained good relationships with the day school. However, as

important as this relationship is, very few programs in this study had set up strategic systems to establish and strengthen this relationship. Professional development can assist by identifying procedures to establish channels of communication, and identifying systematic approaches for after school programs to make contacts and collaborations (e.g., communication logs, planners, email, meetings, and ideas for developing more collaborative program structures like overlap in day school and afterschool program staff, offering afterschool program staff paid time to communicate and work with day-school staff, and administrative support in creating connections to the day school).

Furthermore, state and local educational agencies can organize professional development opportunities for local afterschool programs to share their experiences with each other. State and federal program officers may even want to participate in specific professional development for the delivery of specific curricula together with their programs, so that they can have a realistic expectation of what the program can achieve and help set appropriate benchmarks.

Evaluation and assessment is another area to be considered for changes to afterschool staff development. As outlined in the logic model, continuous evaluation is necessary to gauge program performance and strive for continuous improvement. However, across the programs, evaluation was mostly used to gauge program impact and monitor student progress. Using evaluation as a reflection to guide program improvement was not practiced as frequently, especially at the staff level. Professional development could stress the importance of this continuous feedback loop for the sustainability of program quality, and provide programs with the skills and tools to jump start this learning cycle. First, afterschool staff would need to develop strategies on how to locate/develop reliable self-assessment tools that can measure program growth and improvement. Once programs have the tools to assess program results, professional development should be provided on how to interpret findings and translate assessment results to improve afterschool programming and instructional practices. In addition, student assessment and tracking of student progress should also be a priority in professional development. Through regular monitoring of student work and achievement, afterschool programs can have a better understanding of the needs of their students, and areas of support that need to be improved.

Parent involvement is another area that can be enhanced in afterschool professional development. While the research literature continuously stresses the importance of parent involvement in influencing children's academic outcomes, this study repeatedly found that parents, though very satisfied with the programs, were generally not involved in attending events or volunteering in afterschool programs. This finding is consistent with other literature

on afterschool programs (Huang et al., 2007). These results suggest that perhaps perceived parent involvement and parent expectations are just as important as actual attendance at events. While some parents may be less able to attend afterschool events due to circumstances such as long work hours, other children in the household, being a single parent, and not knowing how to be involved, parents may be highly involved in other ways, such as giving their children access to educational resources (e.g., books, computers) and emphasizing the importance of a good education. Some of the culturally specific ways of being involved may be just as important as attending school events especially for immigrant parents and parents who feel less efficacious in dealing with the educational system (Zhou & Kim, 2006).

Despite the structural constraints families conceivably face, professional development in the area of parent involvement can focus on training staff to view parent involvement as a broad set of behaviors that could involve not only attending school events, communicating with the afterschool staff, but also in providing resources to their children for learning, holding high expectations and aspirations for their children's education, developing and employing social networks to gain information and links to educational opportunities, and providing assistance in their child's school work at home. In understanding and supporting different styles of parental involvement, staff can build partnerships in various forms with parents in supporting the students. Furthermore, professional development can also be helpful in providing staff with ideas on how to develop rapport with parents, such as focusing on student strengths, maintaining frequent communication and contact, offering suggestions and strategies for different forms of parental involvement, emphasizing the importance of parent involvement, and giving parents a voice in afterschool programming decisions.

Afterschool Funding

Another area that can have important influences on the quality of afterschool programming is funding sources. In writing funding contracts, funding agencies can include categories in the budgets specified for professional development, staff stability, and involvement with the day school and parents. Programs can ensure practices that include developing sustainability plans and collaborations to secure future funding when grants end.

As mentioned in the previous section, professional development is a necessity for afterschool staff. Funding agencies should create specific budgets for continuous staff development as a way to ensure that content staff will be adequately prepared and continuously updated with new information. If the goal of funders is to target professional development for specific staff members such as instructors, site coordinators, or coaches, it

should be clearly specified in the contracts for afterschool programs. When allocating funding for training and professional development, the costs of staff time and the cost for the substitutes for the staff members attending professional development should be considered together with the overall cost of the training.

Staff stability is another funding issue that impacts the quality of afterschool programs. The study results indicated that at high functioning programs, staff turnover was considered to be low. More than 60 percent of the staff had at least 1 year at their site and over 30 percent had over 4 years of experiences at the site. Staff stability is important for relationship building, since staff members serve as constant role models and mentors in their students' lives and provide the basis for students to build trust, positive attitudes and efficacy toward learning. To reduce staff turnover in the afterschool field, funders and afterschool administrators should consider incentives for building morale such as rewards (e.g., further educational opportunities such as a grant for tuition). One suggestion would be reward an afterschool team/teacher nominated by parents, teachers, or the students. Recognition of the outstanding performance of specific staff, a site, or program may also offer acknowledgement for high quality performance. A pay scale incentive for years of service and a possible career ladder would also help staff retention. Policy makers and legislators may consider retention plans that establish policies and legislation to recognize program workers' contributions to student success.

Funding issues related to the involvement of the day school and parents with the afterschool program is also related to the quality of the program. In order to ensure linkages between the afterschool programs and day school, some formal agreements should be made prior to the inception of the grant/contract writing. For example, the administration at the day school can connect to certain conditions and resources, such as granting the use of certain facilities at the school, providing time for school teachers and afterschool staff to meet and plan lessons together, establishing a system of communication, etc. (e.g., homework log between day teachers and afterschool staff). Funding agencies can budget additional resources for afterschool programs that would facilitate these linkages with school. For instance, the budget may include a person designated as the day-school liaison who can establish a chain of intentional communication and collaboration with the day school. Additional funding for relationship building such as staff retreats or workshops (together with day-school teachers) can also be a way to form collaborative relationships.

Similarly, to develop relationships and opportunities for parent involvement, funding agencies should budget for parent participation, time for staff to communicate and collaborate with parents, and resources for families. Funding allocated to providing childcare

during parent events, (e.g., ESL, parenting, other educational classes, Open Houses, parent-teacher conferences) will facilitate parent participation. Home visits and family assistance can further solidify the relationships between the afterschool and the families.

The importance of parent involvement specific to afterschool programs and student outcomes should be studied further and more rigorously. If the importance of the relationships is confirmed, policies can be set to encourage parents to make certain contributions of their time when their children enroll in the program. It should be noted that parents' contribution of time should not always require time spent at the program site; a project that the parents work on with their children at home can also be considered as parent involvement.

Continuous Evaluation and Improvement

Continuous evaluation and improvement are important components of high quality afterschool programs. Implications of our findings in this area suggest a need for more systematic evaluation, enforced through local and federal policies and regulations. Specifically, the use of evaluation tools in program planning, curriculum development, and general improvements can lead to improved student outcomes. Standards-based curriculum and research-based instructional strategies are key components of high quality afterschool programs. To ensure that students are benefiting from the curriculum and instruction, periodic student assessments and program evaluations ought to be conducted.

The findings indicated that student assessment was not a common practice across the high performing programs studied. In general, at the 53 programs, student assessments were characterized as informal, including spot checking, questioning, and observing students' understanding. Qualitative findings further revealed that many staff and site coordinators were not familiar with assessment and evaluative tools, and did not have a clear understanding of their purposes. At the afterschool classroom level, periodic assessment should be conducted and focused on monitoring student progress and achievement. Professional development can provide opportunities for afterschool staff to review and understand the purposes and importance of assessment and evaluations in relation to student outcomes. Reliable and simple evaluation and assessment tools need to be developed and used regularly by the afterschool classroom and administrative staff. Program staff can also be trained and encouraged to conduct self-assessments to understand their own knowledge of the curriculum, and their strengths or weaknesses in implementing the curriculum through research-based practices. By implementing more formal and periodic student evaluations, afterschool programs can better gauge student learning and strategically connect student test

scores to the curriculum, as well as make programmatic improvements to better meet student needs.

At the program level, program directors and site coordinators need to clearly define the purposes of evaluations, so that program staff can actively participate in them. For example, assessment information can be used for self-improvement in program planning and curriculum development, other internal evaluations can be used to guide relationship building, administrative procedures, and resource allocation. Through periodic and systematic evaluations, afterschool staff can be made aware of their areas of strengths and weaknesses, and make informed decisions. For instance, under the topic of staffing, self-evaluation tools can be used to understand staff professional development needs, staff utilization of research-based activities, and staff knowledge of standards-based curriculum. Using these assessment results, program directors can implement changes, allocate resources, and design professional development opportunities to further staff expertise in the needed areas.

In addition, multiple perspectives should be sought when gathering evaluation data. Programs need to be encouraged to request parent, student, and community input when evaluating program components. The results of these evaluations ought to serve more than accountability needs, with the interpretation of the findings also guiding continuous program improvement. Consequently, not only will evaluation help programs run smoothly, but it can also help build positive relationships with parents, students, and community members by giving them voice in program planning and improvement.

Furthermore, state and federal guidelines can be established to support programs in their evaluation process. Policymakers can require programs to engage in periodic evaluations, document their progress, identify their strengths and weaknesses, and submit a plan for change (such as curriculum modifications and adaptations to meet student needs and enhance the program outcomes) in addition to the programs' accountability/monitoring reports. As part of the guidelines, a system for interpretation of program results ought to be in place for programs to structure their findings and reset their goals each year. Administrative staff should be given opportunities to be trained in conducting self-assessments of their programs, as well how to translate assessment results into program improvement plans.

State coordinators can also benefit by participating in professional development around evaluation. This development may provide additional efficacy and understanding about the functioning of afterschool programs and create further clarity when the coordinators review the programs' periodic reports. The state coordinators can make use of the findings in the

reports to monitor and initiate conversations with the programs, building rapport with the programs by providing support and resources during the programs' development as part of the collaborative efforts.

Contributions of the National Partnership

One of the major goals for this 5-year study was to offer strategies, tools, and technical assistance to help address two continuing challenges to afterschool programs: (a) ensuring that programs offer high quality, research-based academic content utilizing appropriate methods of teaching and learning; and (b) ensuring that programs are able to attract and retain students who participate regularly and thus can benefit from these investments.

Other than the contributions that this report brings to assist afterschool programs to overcome these challenges, the National Partnership synthesized the study findings on effective practices to develop on-line Afterschool Toolkits in the six content areas (math, literacy, science, arts, technology, and homework help). These Toolkits provide assistance to programs in ensuring high quality, standards-based academic content, and in utilizing research-based teaching and learning strategies. Through the use of the Afterschool Toolkits, concrete strategies are provided to help practitioners build program and staff capacity. The Toolkits offer suggestions, illustrations, and demonstrations on how programs can embed academic learning in all aspects of afterschool activities. During the 5 years of this contract, the Toolkits have been consistently revised and updated as data and findings from the National Partnership became available and as the broader research literature evolved. In addition, professional development on the use of the Toolkits has been continuously provided in national and regional afterschool conferences and workshops. Feedback gathered from these professional development events has also been used to continuously improve the Toolkits. The National Partnership maintains a web site that houses the Toolkits. They are available at the site: www.sedl.org/afterschool.

In addition to the study report and the online Afterschool Toolkits, a separate assessment tool guide,¹² based on the instruments constructed for this study, was developed to assist afterschool programs in self-assessment, both at the program organization level, and the content (math, literacy science, arts, technology, and homework) instructional features level. With current policies and legislation that point to the accountability of Extra Learning Opportunities (ELO), the National Partnership's self-assessment guide provides practitioners a vital resource for self-evaluation. This toolkit includes instruments for programs to examine their curriculum content and instructional practices in the six content areas, and offers

¹² The instruments for the self-assessment guide are a separate report to the U.S. Department of Education.

general guidelines on effective program management and administration. It will help programs to make informed decisions on developing strategies to attract and retain students.

The overall contribution of the National Partnership is illustrated in the Figure 14.

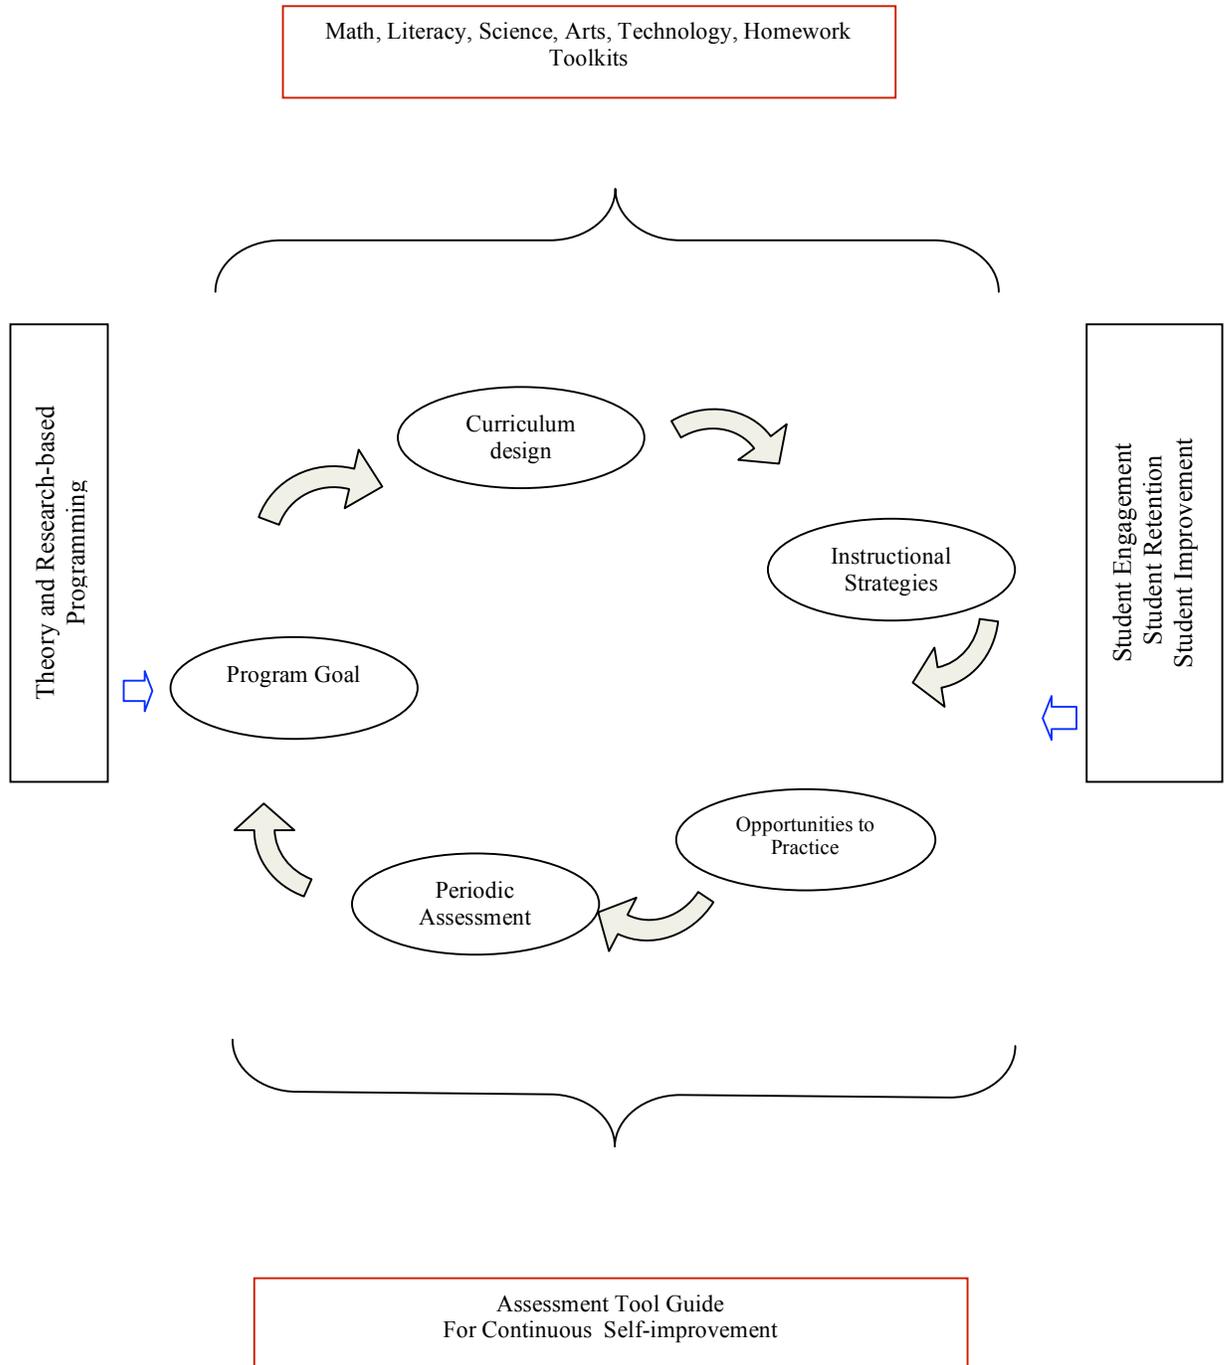

Figure 14. The Toolkits and the Continuous Self Improvement Model.

As illustrated in Figure 14, with the Toolkit, the National Partnership offers self-improvement opportunities for afterschool programs in all essential program components: 1) curriculum design, 2) instructional strategies, 3) opportunities to practice (e.g. suggestions for project durations, follow-up activities, project extension possibilities), 4) periodic assessments, and 5) use of the results of the assessments to fine-tune the program goals. In the future this system can be further expanded and enhanced to include professional development and instruments on goal setting and provide a set of validated rubrics (perhaps also an analytical software to provide simple statistical results for the programs) so that education agencies, funding agencies, and policy makers can use the toolkits to establish standardized expectations for afterschool programs. At least once a year, afterschool programs should take stock of their progress and make plans for refinement. This process will empower sites to make grounded decisions and to improve their program performance.

Study Limitations

While the findings of this study have implications for afterschool programming and future research, a number of limitations should be noted. First, the program participants in this study were carefully selected and represented only a small portion of afterschool programs in the nation. Thus, the findings on this sample cannot be generalized to the afterschool field as a whole. Secondly, since this study sought to conduct extensive site visits and intensive data collection on programs that focused on multiple content areas, there were time lags between Year 1 and Year 3 of data collection. Coincidentally, this was a period of tremendous development and growth, while afterschool activities were generating nationwide attention in education and political arenas. This drastic growth could have contributed to the differences in program content, structure, and practices across programs over the years. Audiences should keep this in mind while interpreting results from one year to the next. Finally, the purpose of this study was to identify the indicators of high quality afterschool programs within the six content areas. Due to the differences in context, a discontinuity of the study design was observed which makes any longitudinal comparisons more difficult.

Conclusion

The National Partnership has successfully accomplished the five major tasks for this project aimed at improving the delivery and quality of academic content, teaching, and professional development in afterschool programs. Fifty-three high functioning programs representative across eight regional divisions of the nation, including rural and urban programs, community-based and school district related programs, were identified using rigorous methods. High quality practices in program organization, program structure, and

especially in content delivery were studied. The findings were synthesized into the Afterschool Toolkits that was made available to programs nationwide via the world-wide-web. Professional development was conducted consistently and extensively throughout the nation.

Stories, such as the one below for students in one of the technology programs visited in this study, clearly indicates that quality in afterschool programs can potentially lead to success for students and society:

XXX kids have become leaders in the day school because of their advanced technology skills and increased confidence [gotten from the afterschool program]. XXX kids represented the school at the State Superintendent's Technology Day at the State Capitol this last winter!" (described by a site coordinator in an interview)

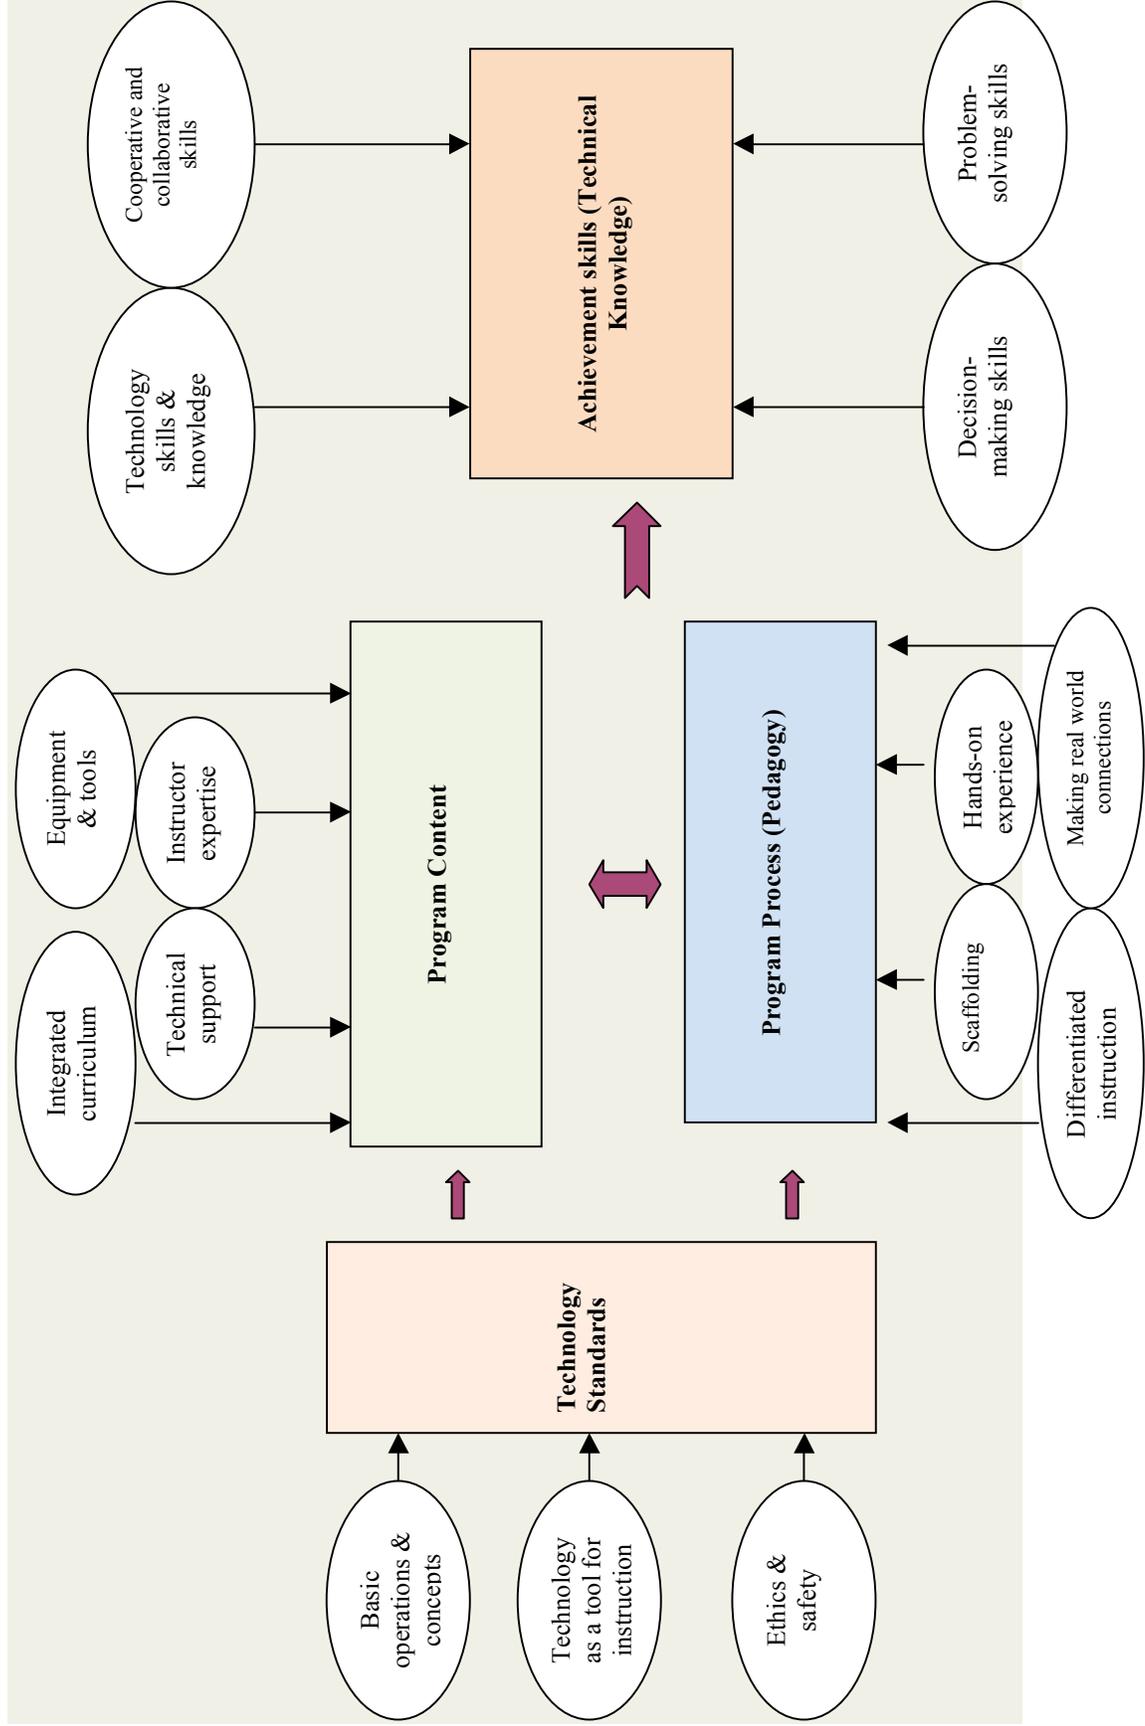

Technology is a part of the environment at this program. The program's goal is not to "teach technology" but to use technology to engage students in their learning and to help the students to become more successful in school. They have certainly aligned and structured their resources and achieved their goal!

Using the Toolkit and self-improvement model (as shown earlier in Figure14) to self-monitor and enhance the program environment, curriculum content, and instructional strategies, all programs will have the capacity and potential to achieve their goal.

Acknowledgments

This report was developed with the support of the U.S. Department of Education as part of the National Partnership for Quality Afterschool Learning project. The content of this report is based on more than 4 years of research and observations at 53 afterschool programs. The authors believe the research results in this report will help afterschool leaders, educators, and policymakers create high quality programs that will motivate, engage, and inspire students' learning and participation.

We extend our appreciation to our data collection teams from Center at the University of North Carolina at Greensboro, Mid-continent Research for Education and Learning (McREL), the Northwest Regional Educational Laboratory (NWREL), SEDL, SERVE, and individual content specialists across the nation.

We especially want to thank our study sites, including their afterschool staff, students, and parents of their afterschool students, as well as the many school district and school staff who assisted in the study by providing data and by assisting in site visits. We appreciate their willingness to respond to many requests and to contribute their perspectives and insights during interviews, focus groups, and observations.

U.S. DEPARTMENT OF EDUCATION

Technical Assistance and Professional Development for
21st Century Community Learning Centers

This report was created with support of the U.S. Department of Education for the use of 21st Century Community Learning Centers. This report is based on more than 4 years of research and observations at 53 afterschool programs across the nation.

NATIONAL PARTNERSHIP FOR QUALITY AFTERSCHOOL LEARNING

Advancing Research, Improving Education
